Abstract

Technologies and approaches in the field of Electronic Commerce are not mature enough in order to allow for their broad successful commercial application. Neither existing, successful approaches that are very much restricted to large companies, specific branches, and business domains, nor approaches just merging new technologies like Internet, WWW, and XML allow for scaling up electronic commerce by means of arbitrarily high numbers of partners. All these approaches lack substantial reflection and integration of business semantics as the basis of any electronic commerce partnership. ebXML is a world-wide initiative that tries to address the drawbacks of existing standards and approaches and has the potential to successfully deliver solutions to these problems. In this paper we address the status of ebXML, and identify open research issues to be solved in order to meet some of the obstacles on the way of a commercial application of ebXML.

1. Introduction

The field of Electronic Commerce obviously can be seen from different perspectives, including the following viewpoints:

One can perceive the field as a hype of new, not very well-understood approaches for doing business electronically, which generated the (timely limited) age of the .com New Economy. In this viewpoint one may come up with the simplified, data-centric formula: *Internet + WWW + XML + some XML vocabulary + some new business model = the new way of doing business*. Approaches that are based on this model are for example BizTalk [15], OAG [17], cXML [1]. Observing the performance of the New Economy recently it looks like that this model to some extent lacks some substantial components in order to be applied successfully by commercial means.

Given the fact that commercially successfully implemented standards like ANSI X12 (since 1979), EDIFACT (since 1987), and SWIFT (since 1973) for exchanging data to do business have already been

established long time ago, the field of Electronic Commerce could be seen as an area of nothing spectacular new, but as a remake of approaches trying to merge new technologies in order to scale up by means of businesses being able to participate in ad-hoc networks of partners performing business electronically. The simplified, data-centric formula for this could be: *EDIFACT concepts + XML + Internet + adapted existing business models = the new way of doing business*. In this model the only new aspect seems to be XML, a new way of organizing data compared to the way of organizing data by EDIFACT. A prominent example of such an approach is xCBL [2, 16] which is based on EDIFACT and ANSI X12. In 1999, due to the growing popularity of XML, United Nations Centre for Trade Facilitation and Electronic Business (UN/CEFACT) also started to look for an XML solution which should be compatible with existing EDIFACT to protect the huge investments taken world-wide.

UN/CEFACT's Techniques and Methodology Working Group (TMWG) was responsible for doing a feasibility study on using XML for B2B information transfer. The TMWG report on this subject rejected the idea of creating 'Yet Another XML Solution' by converting EDIFACT to XML. This decision was mainly based on the fact that a syntactical transformation would hardly solve any EDI problem, but would just add another e-business vocabulary to the XML world.

Following up data-centric approaches mentioned above one can identify approaches trying to include or focusing on process-centric methods, i.e. business processes are becoming a central focus of Electronic Commerce models. Examples of this model are RosettaNet [18] and Open-edi [13]. In fact, the TMWG report mentioned above actually recommended to build up on the Open-edi reference model by using business process modeling to define the business aspects and by using XML as key concept for the technological aspects of e-business transactions. Additionally, TMWG suggested to cooperate in the development of the solution with the IT-industry to combine UN/CEFACT's business know-how with the experience of leading XML experts. The steering committee of UN/CEFACT accepted the TMWG recommendation and found an IT-partner in the Organization for the Advancement of Structured Information Standards (OASIS) that shares the goal of

dictionary is an effort to specify the terminological basis of emerging XML and Semantic Web technologies. The ultimate goal of this dictionary is even broader than just to define the meaning of new words; it aims to develop a proper understanding of these leading edge technologies. To achieve this, comprehensible definitions of technical terms are supported by numerous diagrams and code snippets, clearly annotated and explained. The main areas covered in this dictionary are:

- 1 XML syntax and core technologies such as Namespaces, Infoset and XML Schema
- 2 all the major members of the XML family of technologies such as XSLT, XPath and XLink
- 3 numerous XML based domain specific languages such as NewsML, News Markup Language
- 4 the concept and architecture of the Semantic Web
- 5 key Semantic Web technologies such as RDF, Resource Description Framework, RDF Schema and OWL, Web Ontology Language
- 6 Web services including WSDL, Web Services Description Language and SOAP, Simple Object Access Protocol

Web Services, E-Business, and the Semantic Web Christoph Bussler, Maria E. Orlowska, Jian Yang, 2004-07-26

The 2nd Workshop on Web Services, E-Business and the Semantic Web (WES) was held during June 16-17, 2003 in conjunction with CAiSE 2003, the 15th International Conference on Advanced Information Systems Engineering. The Internet is changing the way businesses operate. Organizations are using the Web to deliver their goods and services, to find trading partners and to link their existing, maybe legacy applications to other applications. Web services are rapidly becoming the enabling technology of today's e-business and e-commerce systems and will soon transform the Web as it is now into a distributed computation and application framework. On the other hand, e-business as an emerging concept is also impacting software applications, the everyday services landscape and the way we do things in almost each domain of our life. There is already a body of experience accumulated to demonstrate the difference between just having an online presence and using the Web as a strategic and functional medium in e-business to business interaction, B2B as well as marketplaces. Finally, the emerging Semantic Web paradigm promises to annotate Web artifacts to enable automated reasoning about them. When applied to e-services, the paradigm hopes to provide substantial automation for activities such as discovery, invocation, assembly and monitoring of e-services. But much work remains to be done before realizing this vision.
