Abramson, Igor Igorevich Stepanov, Riley J. Wincheski, 2024-06-17 The application of mathematical models in the analysis of learning data has a rich tradition in experimental psychology Such modeling is not only of scientific interest from psychophysiological point of view but very important from clinical point of view because memory impairment is a common symptom that is frequently diagnosed in elder people persons after traumatic brain injury patients with type 2 diabetes mellitus Parkinson disease multiple sclerosis and other neurological and psychiatric diseases Mild memory impairment might be one of the most important symptoms of a future Alzheimer s disease Thus early diagnosis of initial signs of memory impairment is of importance The book offers the reader hands on practical experience using a mathematical model developed by the senior authors Classroom tested experiments are provided which requires the reader to use the model under various conditions such as learning and memory in both humans and animals Following an introduction to mathematical models the book contains 13 experiments These experiments include those related to animal learning in such organisms as snails bees and rats A variety of human experiments are also presented including those related to short and long term memory maze learning classical salivary conditioning evaluation of sound on memory and the influence of dietary supplements on memory We close the section on experiments with and analysis of machine learning curves Appendices are provided on how to build apparatus and how to install the software Planaria: A Model for Drug Action and Abuse Robert B. Raffa, 2008-12-03 The study of drug action has benefitted greatly from the development and use of in vivo model systems In model systems manipulations and observations can be more rigorously controlled and screens of novel therapeutic agents can be more safely conducted No single model system provides all of the possible advantages At one end mammalian models al Animal Behavior Ken Yasukawa, 2014-01-22 Discover why animals do what they do based on their genes physiologies cultures traditions survival and mating advantages and evolutionary histories and find out how studying behavior in the animal world helps us understand human behavior The three volumes of Animal Behavior How and Why Animals Do the Things They Do cover the breadth of the field addressing causation development function and evolution in a wide range of animals from invertebrates to humans Inspired by Nobel laureate Nikolaas Tinbergen s work the first two volumes follow Tinbergen s four classic questions of animal behavior while the third volume supplies integrated examples of

Stalinist Science Nikolai Kremmentsov, 1996-11-25 Some scholars have viewed the Soviet state and science as two monolithic entities with bureaucrats as oppressors and scientists as defenders of intellectual autonomy. Based on previously unknown documents from the archives of state and Communist Party agencies and of numerous scientific institutions *Stalinist Science* shows that this picture is oversimplified. Even the reinstated Science Department within the Central Committee was staffed by a leading geneticist and others sympathetic to conventional science. In fact a symbiosis of state bureaucrats and scientists established a much more terrifying system of control over the scientific community than any critic of Soviet totalitarianism had feared. Some scientists on the other hand developed more elaborate devices to avoid and exploit this control system than any advocate of academic freedom could have reasonably hoped. Nikolai Kremmentsov argues that the model of Stalinist science already taking hold during the thirties was reversed by the need for inter Allied cooperation during World War II. Science as a tool for winning the war and as a diplomatic and propaganda instrument began to enjoy higher status better funding and relative autonomy. Even the reinstated Science Department within the Central Committee was staffed by a leading geneticist and others sympathetic to conventional science. However the onset of the Cold War led to a campaign for eliminating such servility to the West. Then the Western links that had benefited genetics and other sciences during the war and through 1946 became a liability and were used by Lysenko and others to turn back to the repressive past and to delegitimize whole research directions.
