Theoretical Aspects of Transition Metal Catalysis Gernot Frenking, 2005-06-23 Transition metal catalysis belongs to the most important chemical research areas because a ubiquitous number of chemical reactions are catalyzed by transition metal compounds Many efforts are being made by industry and academia to find new and more efficient catalysts for chemical processes Transition metals play a prominent role in catalytic research because they have been proven to show an enormous diversity in lowering the activation barrier for chemical reactions For many years the search for new catalysts was carried out by trial and error which was costly and time consuming The understanding of the mechanism of the catalytic process is often not very advanced because it is difficult to study the elementary steps of the catalysis with experimental techniques The development of modern quantum chemical methods for calculating possible intermediates and transition states was a breakthrough in gaining an understanding of the reaction pathways of transition metal catalyzed reactions This volume organized into eight chapters written by leading scientists in the field illustrates the progress made during the last decade The reader will obtain a deep insight into the present state of quantum chemical research in transition metal catalysis

Transition Metal Arene π -Complexes in Organic Synthesis and Catalysis Peter E. Kündig, 2004-09-03 Metal arene π complexes show a rich and varied chemistry The metal adds a third dimension to the planar aromatic compounds and coordination of a metal to an arene thus not only altering the reactivity of ring carbons and substituents but also makes possible reactions that lead to chiral non racemic products This book organized in nine chapters and written by leading scientists in the field provides the reader with an up to date treatise on the subject organized according to reaction type and use It covers the wide spectrum of arene activation from the electrophilic activation of h_6 bound arene by π Lewis acid metal complex fragments to reactions of nucleophilic h_2 coordinated arene complexes The preparation of complexes is detailed as are the scope limitations and challenges of reactions in contemporary π arene metal chemistry with special attention given to asymmetric transformations The emphasis of the book is on transformations of interest to organic synthesis and on the use of the complexes as catalysts or as chiral ligands The book is written for academic and industrial researchers in organic organometallic and inorganic chemistry as well as for advanced chemistry students
