

## 5.3 Semigroup - history

In the history of mathematics, the algebraic theory of semigroups is a relative new-comer, with the theory proper developing only **in the second half of the twentieth century**.

Historically, it can be viewed as an algebraic abstraction of the properties of the composition of transformations on a set.

**Operators and Function Theory** S.C. Power, 2012-12-06 In the modern study of Hilbert space operators there has been an increasingly subtle involvement with analytic function theory This is evident in the analysis of subnormal operators Toeplitz operators and Hankel operators for example On the other hand the operator theoretic viewpoint of interpolation by analytic functions is a powerful one There has been significant activity in recent years within these enriching interactions and the time seemed right for an overview of the main lines of development The Advanced Study Institute Operators and Function Theory in Lancaster 1984 was devoted to this and this book contains expanded versions and one contraction of the main lecture programme These varied articles by prominent researchers include for example a survey of recent results on subnormal operators recent work of Soviet mathematicians on Hankel and Toeplitz operators expositions of the decomposition theory and interpolation theory for Bergman Besov and Bloch spaces with applications for special operators the Krein space approach to interpolation problems and much more It is hoped that these proceedings will bring all this lively mathematics to a wider audience Sincere thanks are due to the Scientific Committee of the North Atlantic Treaty Organisation for the generous support that made the institute possible and to the London Mathematical Society and the British Council for important additional support Warm thanks also go to Barry Johnson and the L M S for early guidance and to my colleague Graham Jameson for much organisational support

**Aerospace Reports**, 1983 Classes of Linear Operators Israel Gohberg, Seymour Goldberg, Marius A. Kaashoek, 2013-03-09 These two volumes constitute texts for graduate courses in linear operator theory The reader is assumed to have a knowledge of both complex analysis and the first elements of operator theory The texts are intended to concisely present a variety of classes of linear operators each with its own character theory techniques and tools For each of the classes various differential and integral operators motivate or illustrate the main results Although each class is treated separately and the first impression may be that of many different theories interconnections appear frequently and unexpectedly The result is a beautiful unified and powerful theory The classes we have chosen are representatives of the principal important classes of operators and we believe that these illustrate the richness of operator theory both in its theoretical developments and in its applications Because we wanted the books to be of reasonable size we were selective in the classes we chose and restricted our attention to the main features of the corresponding theories However these theories have been updated and enhanced by new developments many of which appear here for the first time in an operator theory text In the selection of the material the taste and interest of the authors played an important role **Spectral Theory in Inner Product Spaces and Applications** Jussi Behrndt, Karl-Heinz Förster, Heinz Langer, Carsten Trunk, 2009-01-21 Contains a collection of research papers originating from the 6th Workshop on Operator Theory in Krein Spaces and Operator Polynomials which was held at the TU Berlin Germany December 14 to 17 This work discusses topics such as linear relations
