Sensorimotor Control Of Movement And Posture:

Sensorimotor Control of Movement and Posture Simon C. Gandevia, Uwe Proske, Douglas G. Stuart, 2012-12-06 This collection of contributions on the subject of the neural mechanisms of sensorimotor control resulted from a conference held in Cairns Australia September 3-6 2001 While the three of us were attending the International Union of Physiological Sciences IUPS Congress in St Petersburg Russia in 1997 we discussed the implications of the next Congress being awarded to New Zealand We agreed to organise a satellite to this congress in an area of mutual interest the neuroscience of movement and sensation Australia has a long standing and enviable reputation in the field of neural mechanisms of sensorimotor control Arguably this reached its peak with the award of a Nobel Prize to Sir John Eccles in 1963 for his work on synaptic transmission in the central nervous system Since that time the subject of neuroscience has progressed considerably One advance is the exploitation of knowledge acquired from animal experiments to studies on conscious human subjects In this development Australians have achieved international prominence particularly in the areas of kinaesthesia and movement control This bias is evident in the choice of subject matter for the conference and subsequently this book It was also decided to assign a whole section to muscle mechanics a subject that is often left out altogether from conferences on motor control Cairns is a lovely city and September is a good time to visit it *Sensorimotor Control* Reinhard Dengler, Andon R. Kossev, 2001 Despite the intensive experimental and theoretical studies for over a century the general processes involved in neural control of posture and movement in learning of motor behaviour in healthy subjects and in adaptation in pathology were and remain a challenging problems for the scientists in the field of sensorimotor control The book is the outcome of the Advanced Research Workshop Sensorimotor Control where the focus was on the state and the perspectives of the study in the field Biomechanics and Neural Control of Posture and Movement Jack M. Winters, Patrick E. Crago, 2012-12-06 Most routine motor tasks are complex involving load transmission through out the body intricate balance and eye head shoulder hand torso leg coordination The quest toward understanding how we perform such tasks with skill and grace often in the presence of unpredictable perturbations has a long history This book arose from the Ninth Engineering Foundation Conference on Biomechanics and Neural Control of Movement held in Deer Creek Ohio in June 1996 This unique conference which has met every 2 to 4 years since the late 1960s is well known for its informal format that promotes high level up to date discussions on the key issues in the field The intent is to capture the high quality of the knowledge and discourse that is an integral part of this conference series The book is organized into ten sections Section I provides a brief introduction to the terminology and conceptual foundations of the field of movement science it is intended primarily for students All but two of the remaining nine sections share a common format 1 a designated section editor 2 an introductory didactic chapter solicited from recognized leaders and 3 three to six state of the art perspective chapters Some perspective chapters are followed by commentaries by selected experts that provide balance and insight Section VI is the

largest section and it consists of nine perspective chapters without commentaries

Neural and Computational Modeling of Movement Control

Ning Lan, Vincent C. K. Cheung, Simon C. Gandevia, 2017-04-17

In the study of sensorimotor systems an important research goal has been to understand the way neural networks in the spinal cord and brain interact to control voluntary movement. Computational modeling has provided insight into the interaction between centrally generated commands, proprioceptive feedback signals and the biomechanical responses of the moving body. Research in this field is also driven by the need to improve and optimize rehabilitation after nervous system injury and to devise biomimetic methods of control in robotic devices. This research topic is focused on efforts dedicated to identify and model the neuromechanical control of movement. Neural networks in the brain and spinal cord are known to generate patterned activity that mediates coordinated activation of multiple muscles in both rhythmic and discrete movements e.g. locomotion and reaching. Commands descending from the higher centres in the CNS modulate the activity of spinal networks which control movement on the basis of sensory feedback of various types including that from proprioceptive afferents. The computational models will continue to shed light on the central strategies and mechanisms of sensorimotor control and learning. This research topic demonstrated that computational modeling is playing a more and more prominent role in the studies of postural and movement control. With increasing ability to gather data from all levels of the neuromechanical sensorimotor systems there is a compelling need for novel creative modeling of new and existing data sets because the more systematic means to extract knowledge and insights about neural computations of sensorimotor systems from these data is through computational modeling. While models should be based on experimental data and validated with experimental evidence they should also be flexible to provide a conceptual framework for unifying diverse data sets to generate new insights of neural mechanisms to integrate new data sets into the general framework to validate or refute hypotheses and to suggest new testable hypotheses for future experimental investigation. It is thus expected that neural and computational modeling of the sensorimotor system should create new opportunities for experimentalists and modelers to collaborate in a joint endeavor to advance our understanding of the neural mechanisms for postural and movement control. The editors would like to thank Professor Arthur Prochazka who helped initially to set up this research topic and all authors who contributed their articles to this research topic. Environment Peter A Federolf, Maurice Mohr, Thorsten Stein, Gert-Jan Pepping, Steven van Andel, Gillian Weir, 2023-06-08 The basic understanding of human movement and control of human movement stems largely from laboratory measurements where human movement can be quantified with high precision and accuracy but where the artificial environment compromises ecological validity A good example for this issue was demonstrated in a recent investigation specifically that the walking gait pattern of healthy individuals in a laboratory changed as a function of how many researchers were present during the experiment Observations like these underscore that study volunteers adapt their behavior to the specific laboratory environment and warrant the question of how well we can transfer our lab based understanding of gait patterns and the underlying neuromuscular control system to walking during daily living Another research area where lab based movement assessments have led to conflicting findings is the field of sports injury prevention Many neuromuscular training programs have been shown to be effective in reducing the sport injury rate in athletes by 30 50% or more in a variety of different multi directional sports Nevertheless lab based assessments of the same athletes who completed those training programs were often not able to detect improvements in motor control of sport specific movements or a reduction in joint loading two factors thought to be closely linked with sport injury risk This disconnect suggests that lab based assessments of movement and motor control are often poor indicators of player behavior during real game scenarios and may limit our ability to screen athletes for injury risk or monitor their progress in rehabilitation These examples highlight that we should strive for the assessment and investigation of human movement and motor control in natural environments i.e. where individuals patients athletes or other groups of interest perform explore and interact under real world conditions *Motor Control and Learning* Markus Latash, Francis Lestienne, 2006-05-31 The purpose of the current volume is two fold First The second chapter is co authored by Rosenbaum it presents a series of review papers reflecting the work of Cohen Meulenbroek and Vaughan The authors cent progress in the area of neural control of posture dress in this chapter another central issue of motor and movement Parts I and II Second it focuses on control that of creating motor plans In line with the issues of changes in motor patterns and neurological organizing by David Rosenbaum and his colleagues this structures involved in their production with learning chapter develops the idea of end state comfort as an development and aging Parts III and IV organizing

Neuromechanics and Control of Physical Behavior: from Experimental and Computational Formulations to Bio-inspired Technologies Massimo Sartori,Francisco J. Valero-Cuevas,Alfred C. Schouten,Matthew Tresch,Yoshihiko Nakamura,Manish Sreenivasa,2019-08-15 The term neuromechanics defines an integrative approach that combines the neuromuscular control and the biomechanical

aspects of physical behavior in humans and animals Crucial to this approach is a detailed description and modeling of the interaction between the nervous system and the controlled biomechanical plant Only then do we have the broader context within which to understand evolution movement mechanics neural control energetics disability and rehabilitation In addition to enabling new basic science directions understanding the interrelations between movement neural and mechanical function should also be leveraged for the development of personalized wearable technologies to augment or restore the motor capabilities of healthy or impaired individuals Similarly this understanding will empower us to revisit current approaches to the design and control of robotic and humanoid systems to produce truly versatile human like physical behavior and adaptation in real world environments This Research Topic is therefore poised at an opportune moment to promote understanding of apparently disparate topics into a coherent focus
