Abstract: A low-power long-term ambulatory ECG monitor was developed for the acquisition, storage and processing of three simultaneous leads DL, aVF and V2 with a beat-to-beat heart rate measurement in real time. It provides long-term continuous ECG recordings until 84 h. The monitor uses a QRS complex detection algorithm based on the continuous wavelet transform with splines, which automatically selects the scale for the analysis of ECG records with different sampling frequencies. It includes a lead-off detection to continuously monitor the electrode connections and a real-time system of visual and acoustic alarms to alert users of abnormal conditions in its operation. The monitor presented is based in an ADS1294 analogue front-end with four channels, 24-bit analog-to-digital converters and programmable gain amplifiers, a low-power dual-core ESP32 microcontroller, a microSD memory for data storage in a range of 4 GB to 32 GB and a 1.4 in thin-film transistor liquid crystal display (LCD) variant with a resolution of 128 × 128 pixels. It has programmable sampling rates of 250, 500 and 1000 Hz; a bandwidth of 0 Hz to 50% of the selected sampling rate; a CMRR of −105 dB; an input margin of ±2.4 V; a resolution of 286 nV; and a current consumption of 50 mA for an average battery life of 84 h. The ambulatory ECG monitor was evaluated with the commercial data-acquisition system BIO-PAC MP36 and its module for ECG LABEL SS2LB, simultaneously comparing the morphologies of two ECG records and obtaining a correlation of 91.78%. For the QRS detection in real time, the implemented algorithm had an error less than 5%. The developed ambulatory ECG monitor can be used for the analysis of the dynamics of the heart rate variability in long-term ECG records and for the development of one's own databases of ECG recordings of normal subjects and patients with cardiovascular and noncardiovascular diseases.

1. Introduction

Cardiovascular diseases are the leading cause of death worldwide [1]. Therefore, there is a need for ambulatory (Holter) electrocardiography (ECG) monitors that can supplement traditional medical and clinical care, allowing for the noninvasive evaluation of electrocardiographic abnormalities over long periods of time and permitting the patients to conduct their normal daily activities. In contrast to the standard 12-lead ECG recordings of brief duration used in clinical examinations, where these intermittent cardiac abnormalities during the day may be undetected, the Holter ECG monitor allows one to continuously examine a patient over an extended time of 24 to 48 h, providing a long-term continuous recording [2].

Longterm Ambulatory Electrocardiography:

Long-Term Ambulatory Electrocardiography J.R. Roelandt,P.G. Hugenholtz,2012-12-06 Recent technological developments have brought long term ambulatory electro cardiography to the front of clinical cardiology Its application for solving clinical problems potentially related to cardiac arrhythmias is rapidly increasing In the meantime the method has found widespread use in the identification of patients at risk for cardiac death as well as in the assessment of therapeutic interventions It was the purpose of this symposium to bring together an international group of authorities in order both to provide an overall view of the field and to discuss critically the value of clinical epidemiological and research applications of long term ambulatory electrocardiography in the light of new concepts and recent advances The first section of this volume discusses the methodology and the performance criteria of the equipment and analysis systems In the second section the potentials and problems encountered in the use of long term ambulatory electrocardiography for solving clinical questions and for predicting the occurrence of clinically important arrhythmias are extensively as continuous ST segment monitoring blood dealt with New applications such pressure measurement and other physiologic parameters are also included Prevalence variability and prognostic aspects of ventricular arrhythmias both in normals and in patients with cardiac disease are the subject of section 3 The last section provides a critical review of the use of the method for the evaluation of therapeutic interventions with drugs The editors feel that this volume represents the state of the art in this newly important area of clinical cardiology *Handbook of Cardiac Electrophysiology* Andrea Natale,Oussama M. Wazni,Kalyanam Shivkumar,Francis E. Marchlinski,2020-03-23 The second edition of this bestseller provides a practical user friendly manual guiding the theory and practice of cardiac electrophysiology The handbook provides the specialist in training with a thorough grounding procedures and clinical findings for clinicians It provides a review of the main kinds of arrhythmia with illustrations of typical ECG findings supported where appropriate by correlative imaging It also details the principal diagnostic and therapeutic procedures include implantation of pacemakers resynchronization therapy and ablation techniques Key Features Provides concise user friendly guide to the equipment procedures and clinical findings with which EPs need to be familiar Delivers alternatives resource to the flagship titles available in this field idea for those beginning training or seeking an update Presents extensively updated material to enhance comprehension Includes new treatments and devices for electrophysiologists trained to perform interventional cardiac electrophysiology studies EPS as well as surgical device implantations **Electrocardiography and Cardiac Drug Therapy** Vinzenz Hombach,H.H. Hilger,H. Kennedy,2012-12-06 This book is a comprehensive overview of electrocardiography and the major effects of current cardiac pharmacological therapy on electrocardiography The text is based on work presented at the International Symposium on Non invasive Cardiovascular Diagnosis and Therapy held in May 1987 at the University of Cologne The theme of the book is to review in broad clinical perspective the current state of the art of electrocardiography as it pertains to standard electrocar

diagrams exercise testing ambulatory electrocardiography electrocardiographic telemetry and high resolution electrocardiography Furthermore advance in cardiac drug therapy in relation to diuretics beta blocking drugs antiarrhythmic agents and thrombolytic agents are reviewed The emphasis of the conference and this book is to review the clinical state of the art information and applications in this regard In the initial section on electrocardiography Dr Spodick reviews our present day physiologic and pathophysiologic understanding of systolic time intervals and how they are affected by a variety of cardiac disease states and pharmacologic agents Dr Ellestad examines problems and provides pragmatic tips on exercise testing in the diagnosis of coronary artery disease and advances in exercise scores and computer analysis Dr Graboys reviews the value of exercise testing in the diagnosis and management of patients with serious ventricular arrhythmias Dr Kellermann presents the complimentary role that exercise testing plays in comprehensive follow up therapy of the cardiac patient and the use of exercise for work and physical training Detailed information concerning the interaction of cardiac rehabilitation and ventricular arrhythmias are examined
