United States. Congress. House,2006 *Research Opportunities in Corrosion Science and Engineering* National Research Council,Division on Engineering and Physical Sciences,National Materials Advisory Board,Committee on Research Opportunities in Corrosion Science and Engineering,2011-01-27 The field of corrosion science and engineering is on the threshold of important advances Advances in lifetime prediction and technological solutions as enabled by the convergence of experimental and computational length and timescales and powerful new modeling techniques are allowing the development of rigorous mechanistically based models from observations and physical laws Despite considerable progress in the integration of materials by design into engineering development of products corrosion considerations are typically missing from such constructs Similarly condition monitoring and remaining life prediction prognosis do not at present incorporate corrosion factors Great opportunities exist to use the framework of these materials design and engineering tools to stimulate corrosion research and development to achieve quantitative life prediction to incorporate state of the art sensing approaches into experimentation and materials architectures and to introduce environmental degradation factors into these capabilities Research Opportunities in Corrosion Science and Engineering identifies grand challenges for the corrosion research community highlights research opportunities in corrosion science and engineering and posits a national strategy for corrosion research It is a logical and necessary complement to the recently published book Assessment of Corrosion Education which emphasized that technical education must be supported by academic industrial and government research Although the present report focuses on the government role this emphasis does not diminish the role of industry or academia

Assessment of Corrosion Education National Research Council,Division on Engineering and Physical Sciences,National

Materials Advisory Board, Committee on Assessing Corrosion Education, 2009-03-12 The threat from the degradation of materials in the engineered products that drive our economy keep our citizenry healthy and keep us safe from terrorism and belligerent threats has been well documented over the years And yet little effort appears to have been made to apply the nation s engineering community to developing a better understanding of corrosion and the mitigation of its effects The engineering workforce must have a solid understanding of the physical and chemical bases of corrosion as well as an understanding of the engineering issues surrounding corrosion and corrosion abatement Nonetheless corrosion engineering is not a required course in the curriculum of most bachelor degree programs in MSE and related engineering fields and in many programs the subject is not even available As a result most bachelor level graduates of materials and design related programs have an inadequate background in corrosion engineering principles and practices To combat this problem the book makes a number of short and long term recommendations to industry and government agencies educational institutions and communities to increase education and awareness and ultimately give the incoming workforce the knowledge they need
