Research in Verbal Behavior and Some Neurophysiological Implications Kurt Salzinger, Suzanne Salzinger, 2013-10-22 Research in Verbal Behavior and Some Neurophysiological Implications focuses on varied approaches to the study of language including verbal behavior in animals mimicry linguistics and verbal satiation. The selection first offers information on verbal behavior in animals and dolphin's vocal mimicry as a unique ability and a way toward understanding The book also ponders on the problem of response class in verbal behavior and verbal operant conditioning and awareness Discussions focus on state of the organism as a determinant of response class topography of response common stimulus and common effect The publication takes a look at a behavioral basis for the polarity principle in linguistics acquisition of grammar by children and interdependencies of the bilingual s two languages. The manuscript also elaborates on verbal satiation and exploration of meaning relations and grammatical indicants of speaking style in normal and aphasic speakers The selection is highly recommended for readers wanting to study verbal behavior Studies in Neurolinguistics Haiganoosh Whitaker, Harry A Whitaker, 2013-10-22 Studies in Neurolinguistics Volume 3 presents detailed case histories multi subject experimental studies literature reviews and research papers that employ a variety of experimental and observational techniques This volume contains seven chapters that focus on a wide range of research in the field of neurolinguistics Chapter 1 discusses the various approaches to the problem of auditory comprehension in aphasia A survey of the world s literature on bilingualism and aphasia is provided in chapter 2 The third chapter examines the different models and explanations for conduction aphasia Chapter 4 provides a synthesis of the anatomic physiologic and behavioral research on the role of the limbic system in human communication Chapter 5 presents a model of individual differences in hemispheric functioning in which a number of theories about the left and right hemispheres are analyzed and compared Chapter 6 shows how different levels of language are revealed The last chapter addresses The Ouestion of Electrophysiological Asymmetries Preceding Speech in a study of the readiness potentials over the motor and premotor regions in eight subjects Linguists psychologists and neurologists will find the book highly informative Behavior Analysis and Learning W. David Pierce, Carl D. Cheney, 2013-04-15 Behavior Analysis and Learning Fourth Edition is an essential textbook covering the basic principles in the field of behavior analysis and learned behaviors as pioneered by B F Skinner The textbook provides an advanced introduction to operant conditioning from a very consistent Skinnerian perspective It covers a range of principles from basic respondent conditioning through applied behavior analysis into cultural design Elaborating on Darwinian components and biological connections with behavior the book treats the topic from a consistent worldview of selectionism The functional relations between the organism and the environment are described and their application in accounting for old behavior and generating new behavior is illustrated Expanding on concepts of past editions the fourth edition provides updated coverage of recent literature and the latest findings There is increased inclusion of biological and neuroscience

material as well as more data correlating behavior with neurological and genetic factors. The material presented in this book provides the reader with the best available foundation in behavior science and is a valuable resource for advanced undergraduate and graduate students in psychology or other behavior based disciplines. In addition a website of supplemental resources for instructors and students makes this new edition even more accessible and student friendly

Assessment of Aphasia Otfried Spreen, Anthony H. Risser, 2002-11-21 Spreen and Risser present a comprehensive critical review of available methods for the assessment of aphasia and related disorders in adults and children The authors explore test instruments and approaches that have been used traditionally for the diagnosis of aphasia ranging from bedside screening and ratings to tests of specific aspects of language and to comprehensive and psychometrically standardized aphasia batteries Coverage of other methods reflects newer trends including the areas of functional communication testing of bilingual patients psycholinguistic approaches and pragmatic and discourse related aspects of language in everyday life The authors also examine the expansion of language assessment to individuals with non aphasic neurological disorders such as patients with traumatic brain injury lesions of the right hemisphere the healthy elderly and invidulas with dimentia Taking a flexible and empirical approach to the assessment process in their own clinical practice Spreen and Risser review numerous test instruments and their source for professionals and students in training to choose from in their own use The introductory chapters cover the history of aphasia assessment a basic outline of subtypes of aphasia both neuro anatomically and psycholinguistically and the basic psychometric requirements for assessment instruments The final part discusses issues in general clinical practice specifically questions of test selection and interpretation The book is a thorough and practical resource for speech and language pathologists neuropsychologists and their students and trainees *Imitation and Social* Learning in Robots, Humans and Animals Chrystopher L. Nehaniv, Kerstin Dautenhahn, 2009-04-09 Mechanisms of imitation and social matching play a fundamental role in development communication interaction learning and culture Their investigation in different agents animals humans and robots has significantly influenced our understanding of the nature and origins of social intelligence Whilst such issues have traditionally been studied in areas such as psychology biology and ethnology it has become increasingly recognised that a constructive approach towards imitation and social learning via the synthesis of artificial agents can provide important insights into mechanisms and create artefacts that can be instructed and taught by imitation demonstration and social interaction rather than by explicit programming This book studies increasingly sophisticated models and mechanisms of social matching behaviour and marks an important step towards the development of an interdisciplinary research field consolidating and providing a valuable reference for the increasing number of researchers in the field of imitation and social learning in robots humans and animals **Research Grants Index** National Institutes of Health (U.S.). as well as confrontation of concepts and methods from separated sometimes distant domains of knowledge For instance the fields of psychology and psychopathology benefited from accumulated contributions from cognitive neurosciences which in turn received insights from molecular chemistry cellular biology physics neuroimaging statistics and computer sciences data processing etc From the results of these researches one can argue that among the numerous cognitive phenomena supposedly involved in the emergence the human intelligence and organized behavior some of them are specific to the social nature of our phylogenetic order Scientific reductionism allowed to divide the social cognitive system into several components i e emotion processing and regulation mental state inference theory of mind agency etc New paradigms were progressively designed to investigate these processes within highly controlled laboratory settings Moreover the related constructs were successful at better understanding psychopathological conditions such as autism and schizophrenia with partial relationships with illness outcomes Here we would like to outline the parallel development of concepts in social neurosciences and in other domains such as computer science affective computing virtual reality development and even hardware technologies While several researchers in neurosciences pointed out the necessity to consider naturalistic social cognition Zaki and Ochsner Ann N Y Acad Sci 1167 16 30 2009 the second person perspective Schilbach et al Behav Brain Sci 36 4 393 414 2013 and reciprocity de Bruin et al Front Hum Neurosci 6 151 2012 both computer and software developments allowed more and more realistic real time models of our environment and of virtual humans capable of some interaction with users As noted at the very beginning of this editorial a new convergence between scientific disciplines might occur from which it is tricky to predict the outcomes in terms of new concepts methods and uses Although this convergence is motivated by the intuition that it fits well ongoing societal changes increasing social demands on computer technologies augmenting funding it comes with several difficulties for which the current Frontiers in topic strives to bring some positive answers and to provide both theoretical arguments and experimental examples The first issue is about concepts and vocabulary as the contributions described in the following are authored by neuroscientists computer scientists psychopathologists etc A special attention was given during the reviewing process to stay as close as possible to the publication standards in psychological and health sciences and to avoid purely technical descriptions The second problem concerns methods more complex computerized interaction models results in unpredictable and poorly controlled experiments In other words the assets of naturalistic paradigms may be alleviated by the difficulty to match results between subjects populations conditions Of course this practical question is extremely important for investigating pathologies that are associated with profoundly divergent behavioral patterns Some of the contributions of this topic provide description of strategies that allowed to solve these difficulties at least partially The last issue is about heterogeneity of the objectives of the researches presented here While selection criteria focused on the use of innovative technologies to assess or improve social cognition the fields of application of this approach were quite unexpected In an attempt to organize the contributions three

directions of research can be identified 1 how innovation in methods might improve understanding and assessment of social cognition disorders or pathology 2 within the framework of cognitive behavioral psychotherapies CBT how should we consider the use of virtual reality or augmented reality 3 which are the benefits of these techniques for investigating severe mental disorders schizophrenia or autism and performing cognitive training The first challenging question is insightfully raised in the contribution of Timmermans and Schilbach 2014 giving orientations for investigating alterations of social interaction in psychiatric disorders by the use of dual interactive eye tracking with virtual anthropomorphic avatars Joyal Jacob and collaborators 2014 bring concurrent and construct validities of a newly developed set of virtual faces expressing six fundamental emotions The relevance of virtual reality was exemplified with two contributions focusing on anxiety related phenomena Jackson et al 2015 describe a new environment allowing to investigate empathy for dynamic FACS coded facial expressions including pain Based on a systematic investigation of the impact of social stimuli modalities visual auditory Ruch and collaborators are able to characterize the specificity of the interpretation of laughter in people with gelotophobia 2014 On the issue of social anxiety Aymerich Franch et al 2014 presented two studies in which public speaking anxiety has been correlated with avatars similarity of participants self representations. The second issue focuses on how advances in virtual reality may benefit to cognitive and behavioral therapies in psychiatry These interventions share a common framework that articulates thoughts feelings or emotions and behaviors and proposes gradual modification of each of these levels thanks to thought and schema analysis stress reduction procedures etc They were observed to be somehow useful for the treatment of depression stress disorders phobias and are gaining some authority in personality disorders and addictions The main asset of new technologies is the possibility to control the characteristics of symptom eliciting stimuli situations and more precisely the degree to which immersion is enforced For example Baus and Bouchard 2014 provide a review on the extension of virtual reality exposure based therapy toward recently described augmented reality exposure based therapy in individuals with phobias Concerning substance dependence disorders Hone Blanchet et collaborators 2014 present another review on how virtual reality can be an asset for both therapy and craving assessment stressing out the possibilities to simulate social interactions associated with drug seeking behaviors and even peers pressure to consume The last issue this Frontiers topic deals with encompasses the questions raised by social cognitive training or remediation in severe and chronic mental disorders autistic disorders schizophrenia Here therapies are based on drill and practice or strategy shaping procedures and most of the time share an errorless learning of repeated cognitive challenges Computerized methods were early proposed for that they do effortlessly and with limited costs repetitive stimulations While repetition was incompatible with realism in the social cognitive domain recent advances provide both immersion and full control over stimuli Georgescu and al 2014 exhaustively reviews the use of virtual characters to assess and train non verbal communication in high functioning autism HFA Grynszpan and Nadel 2015 present an original eye tracking method to reveal the link between gaze patterns and

pragmatic abilities again in HFA About schizophrenia Oker and collaborators 2015 discuss and report some insights on how an affective and reactive virtual agents might be useful to assess and remediate several defects of social cognitive disorders About assessment within virtual avatars on schizophrenia Park et al 2014 focused on effect of perceived intimacy on social decision making with schizophrenia patients Regarding schizophrenia remediation Peyroux and Franck 2014 presented a new method named RC2S which is a cognitive remediation program to improve social cognition in schizophrenia and related disorders To conclude briefly while it is largely acknowledged that social interaction can be studied as a topic of its own all the contributions demonstrate the added value of expressive virtual agents and affective computing techniques for the experimentation It also appears that the use of virtual reality is at the very beginning of a new scientific endeavor in cognitive sciences and medicine

The discovery of this basic unitary notion is surely one of the reasons for the new interest in these phenomena In light of all this a bibliography cannot at present avoid being highly selective in order to demarcate an interdisciplinary area of research in its own right and with its own status The establishment of such an area is one of our main aims The focus of interest in this bibliography admittedly is directed towards the psycholinguistics of language contact and interaction Research Awards Index ,1984 Michael S.
