Watkins, 2012-12-06 This volume has been created in honor of the seventieth birthday of Ted Harris which was celebrated on January 11th 1989 The papers represent the wide range of subfields of probability theory in which Ted has made profound and fundamental contributions This breadth in Ted's research complicates the task of putting together in his honor a book with a unified theme One common thread noted was the spatial or geometric aspect of the phenomena Ted investigated This volume has been organized around that theme with papers covering four major subject areas of Ted's research branching processes percolation interacting particle systems and stochastic flows These four topics do not exhaust his research interests his major work on Markov chains is commemorated in the standard technology Harris chain and Harris recurrent The editors would like to take this opportunity to thank the speakers at the symposium and the contributors to this volume Their enthusiastic support is a tribute to Ted Harris We

would like to express our appreciation to Annette Mosley for her efforts in typing the manuscripts and to Arthur Ogawa for typesetting the volume Finally we gratefully acknowledge the National Science Foundation and the University of Southern California for their financial support

The Dynkin Festschrift Mark I. Freidlin, 2012-12-06 Onishchik A A Kirillov and E B Vinberg who obtained their first results on Lie groups in Dynkin's seminar At a later stage the work of the seminar was greatly enriched by the active participation of I. Pyatetskii Shapiro As already noted Dynkin started to work in probability as far back as his undergraduate studies In fact his first published paper deals with a problem arising in Markov chain theory The most significant among his earliest probabilistic results concern sufficient statistics In 15 and 17 Dynkin described all families of one dimensional probability distributions admitting non trivial sufficient statistics These papers have considerably influenced the subsequent research in this field But Dynkin's most famous results in probability concern the theory of Markov processes Following Kolmogorov Feller Doob and Ito Dynkin opened a new chapter in the theory of Markov processes He created the fundamental concept of a Markov process as a family of measures corresponding to various initial times and states and he defined time homogeneous processes in terms of the shift operators t In a joint paper with his student A

Stochastic Processes Pierre Del Moral, Spiridon Penev, 2017-02-24 Unlike traditional books presenting stochastic processes in an academic way this book includes concrete applications that students will find interesting such as gambling finance physics signal processing statistics fractals and biology Written with an important illustrated guide in the beginning it contains many illustrations photos and pictures along with several website links Computational tools such as simulation and Monte Carlo methods are included as well as complete toolboxes for both traditional and new computational techniques

Stochastic Analysis and Applications A.B. Cruzeiro, J.C. Zambrini, 2012-12-06 At the end of the summer 1989 an international conference on stochastic analysis and related topics was held for the first time in Lisbon Portugal This meeting was made possible with the help of INIC and JNICT two organizations devoted to the encouragement of scientific research in Portugal The meeting was interdisciplinary since mathematicians and mathematical physicists from around the world were invited to present their recent works involving probability theory analysis geometry and physics a wide area of cross fertilization in recent years Portuguese scientific research is expanding fast these days faster some times than the relevant academic structures The years to come will be determinant for the orientation of those young Portuguese willing to take an active part in the international scientific community Lisbon's summer 89 meeting should initiate a new Iberic tradition attractive both for these researchers to be and of course for the selected guests Judging by the quality of contributions collected here it is not unrealistic to believe that a tradition of southern randomness may well be established

Stochastic Analysis and Related Topics VII Laurent Decreusefond, Bernt Øksendal, Ali S. Üstünel, 2012-12-06 One of the most challenging subjects of stochastic analysis in relation to physics is the analysis of heat kernels on infinite dimensional manifolds The simplest nontrivial case is that of the path and loop space on a Lie group In this volume an up to date survey of the topic is given by Leonard Gross a prominent developer of the theory Another concise but complete survey of Hausdorff measures on Wiener space and its applications to Malliavin Calculus is given by D Feyel one of the most active specialists in this area Other survey articles deal with short time asymptotics of diffusion processes with values in infinite dimensional manifolds and large deviations of diffusions with discontinuous drifts A thorough survey is given of stochastic integration with respect to the fractional Brownian motion as well as Stokes formula for the Brownian sheet and a new version of the log Sobolev inequality on the Wiener space Professional mathematicians looking for an overview of the state of the art in the above subjects will find this book helpful In addition graduate students as well as researchers whose domain requires stochastic analysis will find the original results of interest for their own research The organizers acknowledge gratefully the financial help of the University of Oslo and the invaluable aid of Professor Bernt Øksendal and l Ecole Nationale Supérieure des Telecommunications

Stable Processes and Related Topics Cambanis, 2012-12-06 The Workshop on Stable Processes and Related Topics took place at Cornell University in January 9 13 1990 under the sponsorship of the Mathematical Sciences Institute It attracted an international roster of probabilists from Brazil Japan Korea Poland Germany Holland and France as well as the U S This volume contains a sample of the papers presented at the Workshop All the papers have been refereed Gaussian processes have been studied extensively over the last fifty years and form the bedrock of stochastic modeling Their importance stems from the Central Limit Theorem They share a number of special properties which facilitates their analysis and makes them particularly suitable to statistical inference The

many properties they share however is also the seed of their limitations What happens in the real world away from the ideal Gaussian model The non Gaussian world may contain random processes that are close to the Gaussian What are appropriate classes of nearly Gaussian models and how typical or robust is the Gaussian model amongst them Moving further away from normality what are appropriate non Gaussian models that are sufficiently different to encompass distinct behavior yet sufficiently simple to be amenable to efficient statistical inference The very Central Limit Theorem which provides the fundamental justification for approximate normality points to stable and other infinitely divisible models Some of these may be close to and others very different from Gaussian models

INFINITELY DIVISIBLE RANDOM MEASURES AND SUPERPROCESSES DONALD A DAWSON 1 Introduction

High Dimensional Probability II

Evarist Giné,David M. Mason,Jon A. Wellner,2012-12-06 High dimensional probability in the sense that encompasses the topics represented in this volume began about thirty years ago with research in two related areas limit theorems for sums of independent Banach space valued random vectors and general Gaussian processes An important feature in these past research studies has been the fact that they highlighted the essential probabilistic nature of the problems considered In part this was because by working on a general Banach space one had to discard the extra and often extraneous structure imposed by random variables taking values in a Euclidean space or by processes being indexed by sets in \mathbb{R} or \mathbb{R}^d Doing this led to striking advances particularly in Gaussian process theory It also led to the creation or introduction of powerful new tools such as randomization decoupling moment and exponential inequalities chaining isoperimetry and concentration of measure which apply to areas well beyond those for which they were created The general theory of empirical processes with its vast applications in statistics the study of local times of Markov processes certain problems in harmonic analysis and the general theory of stochastic processes are just several of the broad areas in which Gaussian process techniques and techniques from probability in Banach spaces have made a substantial impact Parallel to this work on probability in Banach spaces classical probability and empirical process theory were enriched by the development of powerful results in strong approximations

Probability in Banach Spaces 6 Haagerup,2012-12-06 This

volume contains a selection of papers by the participants of the 6 International Conference on Probability in Banach Spaces Sandbjerg Denmark June 16 D1 1986 The conference was attended by 45 participants from several countries One thing makes this conference completely different from the previous five ones namely that it was arranged jointly in Probability in Banach spaces and Banach space theory with almost equal representation of scientists in the two fields Though these fields are closely related it seems that direct collaboration between researchers in the two groups has been seldom It is our feeling that the conference where the participants were together for five days taking part in lectures and intense discussions of mutual problems has contributed to a better understanding and closer collaboration in the two fields The papers in the present volume do not cover all the material presented in the lectures several results covered have been published elsewhere The sponsors of the conference are The Carlsberg Foundation The Danish Natural Science Research Council The Danish Department of Education The Department of Mathematics Odense University The Department of Mathematics Aarhus University The Knudsen Foundation Odense Odense University The Research Foundation of Aarhus University The Thborg Foundation The participants and the organizers would like to thank these institutions for their support The Organizers Contents A de Acosta and M Ledoux On the identification of the limits in the law of the iterated logarithm in Banach spaces

Probability in Banach Spaces 7 Eberlein,Kölbs,Marcus,2012-12-06 The first international conference on Probability in Banach Spaces was held at Oberwolfach West Germany in 1975 It brought together European researchers who under the inspiration of the Schwartz Seminar in Paris were using probabilistic methods in the study of the geometry of Banach spaces a rather small number of probabilists who were already studying classical limit laws on Banach spaces and a larger number of probabilists specialists in various aspects of the study of Gaussian processes whose results and techniques were of interest to the members of the first two groups This first conference was very fruitful It fostered a continuing relationship among 50 to 75 probabilists and analysts working on probability on infinite dimensional spaces the geometry of Banach spaces and the use of random methods in harmonic analysis Six more international conferences were held since the 1975 meeting Two of the meetings were held at Tufts University one at Sønderborg Denmark and the others at Oberwolfach This volume contains a selection of papers by the participants of the Seventh International Conference held at Oberwolfach West Germany June 26 July 2 1988 This exciting and provocative conference was attended by more than 50 mathematicians from many countries These papers demonstrate the range of interests of the conference participants In addition to the ongoing study of classical and modern limit theorems in Banach spaces a branching out has occurred among the members of this group
