

A Seminar on

SEQUENTIAL DECODING by STACK ALGORITHM

1. INTRODUCTION

During the transmission process when the transmitted signal passes through some noisy channel, due to noise interference errors are introduced in the received data. These errors can be detected and corrected using Coding Technique.

Types of Coding Technique:

- 1) Block codes
- 2) Convolutional codes

In **block coding**, the encoder accepts a k -bit message block and generates an n -bit codeword. Thus, code words are produced on a **block-by-block** basis. So, provision must be made in encoder to buffer an entire message block before generating the associated codeword. However, there are applications where the message bits come in serially rather than in large blocks, in which case the use of a buffer may be undesirable. In such situations, the use of **convolution coding** is preferred.

2. CONVOLUTIONAL CODE

Convolutional codes were first introduced by Elias in 1955 as an alternative to block codes. Wozencraft proposed sequential decoding as an efficient decoding scheme for convolutional codes.

The convolutional coding technique is designed to reduce the probability of erroneous transmission over noisy communication channels.

A binary convolutional code is denoted by a three-tuple $(n; k; m)$, which corresponds to an encoder for which n output bits are generated whenever k input bits are received, and for which the current n outputs are linear combinations of the present k input bits and the previous $m \times k$ input bits.

Sequential Decoding:

Sequential Decoding John M. Wozencraft, Barney Reiffen, 1961 *Study of Sequential Decoding*, 1972 **ON**

SEQUENTIAL DECODING. S. Lin, HAWAII UNIV HONOLULU DEPT OF ELECTRICAL ENGINEERING., 1967 By a proper selection of distance metric it is possible to show that the average number of computations for the Wozencraft sequential decoding algorithm can be bounded independently of the code constraint length for transmission rates below a computation rate R_{comp} . The bound on the probability of decoding error is proved to be similar to the bound for Fano's algorithm. A modification of the Wozencraft algorithm is presented. Use of a multiple threshold test (MTT) enables the decoder to adjust its operation to the noise conditions. A modified search procedure is also presented. Analytical results show that this modified algorithm is comparable with Fano's algorithm in terms of the average number of computations and the probability of error.

Author *Cryptography and Coding* Colin Boyd, 1995-12 This monograph provides a formal and systematic exposition of the main results on the existence and optimality of equilibria in economies with increasing returns to scale. For that a general equilibrium model is carefully constructed first by means of a precise formalization of consumers and firms and the proof of an abstract existence result. The analysis shifts then to the study of specific normative and positive models which are particularizations of the general one and to the study of the efficiency of equilibrium allocations. The book provides a unified approach of the topic; it maintains a relatively low mathematical complexity and offers a highly self-contained exposition.

Advances in Communication Systems A. V. Balakrishnan, 2014-06-28 *Advances in Communication Systems Theory and Applications* Volume 3 focuses on feedback systems, data compression, satellite communications, decoding techniques, and synchronization. The selection first elaborates on sequential signal design for channels with feedback and adaptive data compression for video signals. Discussions focus on theory and application of an adaptive compression system, feedback systems with an average power constraint, and a time-continuous binary system with peak and average power constraints. The text then ponders on the aspects of communications satellite systems, including communications satellites and modulation methods. The manuscript takes a look at advances in threshold signal design, problem of coding and synchronization, and progress in sequential decoding. Topics include Wozencraft sequential decoding algorithm, phased locked loop approach, rapid acquisition sequences, and optimality of the square wave correlation function for the first order loop. The selection is a vital source of data for researchers interested in feedback systems, satellite communications, synchronization, and decoding techniques.

Error-Correction Coding for Digital Communications George C. Clark Jr., J. Bibb Cain, 2013-06-29 Error correction coding is being used on an almost routine basis in most new communication systems Not only is coding equipment being used to increase the energy efficiency of communication links but coding ideas are also providing innovative solutions to many related communication problems Among these are the elimination of intersymbol interference caused by filtering and multipath and the improved demodulation of certain frequency modulated signals by taking advantage of the natural coding provided by a continuous phase Although several books and numerous articles have been written on coding theory there are still noticeable deficiencies First the practical aspects of translating a specific decoding algorithm into actual hardware have been largely ignored The information that is available is sketchy and is widely dispersed Second the information required to evaluate a

particular technique under situations that are encountered in practice is available for the most part only in private company reports This book is aimed at correcting both of these problems It is written for the design engineer who must build the coding and decoding equipment and for the communication system engineer who must incorporate this equipment into a system It is also suitable as a senior level or first year graduate text for an introductory one semester course in coding theory The book Uses a minimum of mathematics and entirely avoids the classical theorem proof approach that is often seen in coding texts
