Notice that  $\sin(x)$  is an odd function.  
i.e.  $\sin(-x) = -\sin(x)$

*A Biologist's Guide to Mathematical Modeling in Ecology and Evolution* Sarah P. Otto,Troy Day,2011-09-19 Thirty years ago biologists could get by with a rudimentary grasp of mathematics and modeling Not so today In seeking to answer fundamental questions about how biological systems function and change over time the modern biologist is as likely to rely on sophisticated mathematical and computer based models as traditional fieldwork In this book Sarah Otto and Troy Day provide biology students with the tools necessary to both interpret models and to build their own The book starts at an elementary level of mathematical modeling assuming that the reader has had high school mathematics and first year calculus Otto and Day then gradually build in depth and complexity from classic models in ecology and evolution to more intricate class structured and probabilistic models The authors provide primers with instructive exercises to introduce readers to the more advanced subjects of linear algebra and probability theory Through examples they describe how models have been used to understand such topics as the spread of HIV chaos the age structure of a country speciation and extinction Ecologists and evolutionary biologists today need enough mathematical training to be able to assess the power and limits of biological models and to develop theories and models themselves This innovative book will be an indispensable guide to the world of mathematical models for the next generation of biologists A how to guide for developing new mathematical models in biology Provides step by step recipes for constructing and analyzing models Interesting biological applications Explores classical models in ecology and evolution Questions at the end of every chapter Primers cover important mathematical topics Exercises with answers Appendixes summarize useful rules Labs and advanced material available

[Numerical Methods for Experimental Mechanics](#) Donald Berghaus,2013-11-27 The purpose of this book is to place a resource in the hands of experimental mechanics researchers to enable them to understand and to obtain a working familiarity with certain of the numerical methods particularly useful to the field The book is organized to permit readers to study the methods and to observe their application in experimental problems It is also intended to encourage readers to directly apply the methods to the same problems or to similar problems of their choosing To this end computer programs are available electronically together with data for easy application Program listings are given in the appendix There are four chapters which make up the

central coverage of the text The first of these deals with least square methods of problem solution both for curve fitting and for general solution of overdetermined problems Nonlinear least squares methods are included Secondly splines specifically smoothed splines are covered including specification of boundary conditions for the latter Use for differentiation is emphasized with attention to control of possible excesses in smoothing Transform methods are the third major area covered both the Discrete Fourier Transform and the Fast Fourier Transform Their combined use is described for appropriate problems Finally digital filters are included principally the Butterworth low pass filter Coverage also includes different filter orders high pass filters and the two pass filter technique The author has had experience with the four areas covered and with all of the example problems described in the text

**Advanced Mathematical Methods for Scientists and Engineers I** Carl M. Bender, Steven A. Orszag, 2013-03-09 The triumphant vindication of bold theories are these not the pride and justification of our life's work Sherlock Holmes The Valley of Fear Sir Arthur Conan Doyle The main purpose of our book is to present and explain mathematical methods for obtaining approximate analytical solutions to differential and difference equations that cannot be solved exactly Our objective is to help young and also established scientists and engineers to build the skills necessary to analyze equations that they encounter in their work Our presentation is aimed at developing the insights and techniques that are most useful for attacking new problems We do not emphasize special methods and tricks which work only for the classical transcendental functions we do not dwell on equations whose exact solutions are known The mathematical methods discussed in this book are known collectively as asymptotic and perturbative analysis These are the most useful and powerful methods for finding approximate solutions to equations but they are difficult to justify rigorously Thus we concentrate on the most fruitful aspect of applied analysis namely obtaining the answer We stress care but not rigor To explain our approach we compare our goals with those of a freshman calculus course A beginning calculus course is considered successful if the students have learned how to solve problems using calculus

**Geographic Information Science** Max J.

Egenhofer, Christian Freksa, Harvey J. Miller, 2005-01-11 This section gives a description of notions used throughout this study Current achievements in developing action centered ontologies are also discussed

2 1 Ontologies In the context of information extraction and retrieval different kinds of ontologies can be distinguished

15 Top level ontologies describe very general concepts like space and time not depending on a particular domain Domain ontologies and task ontologies describe the vocabulary related to a generic domain or kind of task detailing the terms used in the top level ontology Application ontologies describe the concepts that depend on the particular domain and task within a specific activity Several investigations have been conducted to bring actions tasks to bear on tologies Among them are Chandrasekaran et al 6 and Mizoguchi et al 23 in the fields of AI and Knowledge Engineering For the geospatial domain Kuhn 21 and Raubal and Kuhn 26 have attempted to support human actions in ontologies for transportation Acknowledging the importance of human actions in the geographic domain a research workshop was held in 2002 bringing together experts from diff ent disciplines to share the knowledge and work on this issue

1 Camara 5 one of the workshop participants has proposed that action driven spatial ontologies are formed via category theory for the case of emergency action plans
