Forger, 2024-08-06 An introduction to the mathematical computational and analytical techniques used for modeling biological rhythms presenting

tools from many disciplines and example applications All areas of biology and medicine contain rhythms and these behaviors are best understood through mathematical tools and techniques This book offers a survey of mathematical computational and analytical techniques used for modeling biological rhythms gathering these methods for the first time in one volume Drawing on material from such disciplines as mathematical biology nonlinear dynamics physics statistics and engineering it presents practical advice and techniques for studying biological rhythms with a common language The chapters proceed with increasing mathematical abstraction Part I on models highlights the implicit assumptions and common pitfalls of modeling and is accessible to readers with basic knowledge of differential equations and linear algebra Part II on behaviors focuses on simpler models describing common properties of biological rhythms that range from the firing properties of squid giant axon to human circadian rhythms Part III on mathematical techniques guides readers who have specific models or goals in mind Sections on frontiers present the latest research theory sections present interesting mathematical results using more accessible approaches than can be found elsewhere Each chapter offers exercises Commented MATLAB code is provided to help readers get practical experience The book by an expert in the field can be used as a textbook for undergraduate courses in mathematical biology or graduate courses in modeling biological rhythms and as a reference for researchers
