Mathematical Ecology:

Mathematical Ecology Thomas G. Hallam,Simon A. Levin,2012-12-06 There isprobably no more appropriate location to hold a course on mathematical ecology than Italy the countryofVito Volterra a founding father ofthe subject The Trieste 1982Autumn Course on Mathematical Ecology consisted of four weeksofvery concentrated scholasticism and aestheticism The first weeks were devoted to fundamentals and principles ofmathematicalecology A nucleusofthe material from the lectures presented during this period constitutes this book The final week and a half of the Course was apportioned to the Trieste Research Conference on Mathematical Ecology whose proceedings have been published as Volume 54 Lecture Notes in Biomathematics Springer Verlag The objectivesofthe first portionofthe course wereambitious and probably unattainable Basic principles of the areas of physiological population com munitY and ecosystem ecology that have solid ecological and mathematical foundations were to be presented Classical terminology was to be introduced important fundamental topics were to be developed some past and some current problems of interest were to be presented and directions for possible research were to be provided Due to time constraints the coverage could not be encyclopedic many areas covered already have merited treatises of book length Consequently preliminary foundation material was covered in some detail but subject overviewsand area syntheseswerepresented when research frontiers were being discussed These lecture notes reflect this course philosophy *Elements of Mathematical Ecology* Mark Kot,2001-07-19 An introduction to classical and modern mathematical models methods and issues in population ecology **An Introduction to Mathematical Ecology** E. C. Pielou,1969 Population dynamics Spatial patterns in one species populations Spatial relations of two or more species Many species populations *Mathematical Ecology of Populations and Ecosystems* John Pastor,2008-08-11 MATHEMATICAL ECOLOGY Population ecologists study how births and deaths affect the dynamics of populations and communities while ecosystem ecologists study how species control the flux of energy and materials through food webs and ecosystems Although all these processes occur simultaneously in nature the mathematical frameworks bridging the two disciplines have developed independently Consequently this independent development of theory has impeded the cross fertilization of population and ecosystem ecology Using recent developments from dynamical systems theory this advanced undergraduate graduate level textbook shows how to bridge the two disciplines seamlessly The book shows how bifurcations between the solutions of models can help understand regime shifts in natural populations and ecosystems once thresholds in rates of births deaths consumption competition nutrient inputs and decay are crossed Mathematical Ecology is essential reading for students of ecology who have had a first course in calculus and linear algebra or students in mathematics wishing to learn how dynamical systems theory can be applied to ecological problems *Applied Mathematical Ecology* Simon A. Levin,Thomas G. Hallam,Louis J. Gross,2012-12-06 The Second Autumn Course on Mathematical Ecology was held at the Intern ational Centre for Theoretical Physics in Trieste Italy in November and December of 1986 During the four year period that had

elapsed since the First Autumn Course on Mathematical Ecology sufficient progress had been made in applied mathemat ical ecology to merit tilting the balance maintained between theoretical aspects and applications in the 1982 Course toward applications The course format while similar to that of the first Autumn Course on Mathematical Ecology consequently focused upon applications of mathematical ecology Current areas of application are almost as diverse as the spectrum covered by ecology The topiys of this book reflect this diversity and were chosen because of perceived interest and utility to developing countries Topical lectures began with foundational material mostly derived from Math ematical Ecology An Introduction a compilation of the lectures of the 1982 course published by Springer Verlag in this series Volume 17 and when possible progressed to the frontiers of research In addition to the course lectures workshops were arranged for small groups to supplement and enhance the learning experience Other perspectives were provided through presentations by course participants and speakers at the associated Research Conference Many of the research papers are in a companion volume Mathematical Ecology Proceedings Trieste 1986 published by World Scientific Press in 1988 This book is structured primarily by application area Part II provides an introduction to mathematical and statistical applications in resource management **Mathematical Modeling in Ecology** C. Jeffries,2012-12-06 Mathematical ecology is the application of mathematics to describe and understand ecosystems There are two main approaches One is to describe natural communities and induce statistical patterns or relationships which should generally occur However this book is devoted entirely to introducing the student to the second approach to study deterministic mathematical models and on the basis of mathematical results on the models to look for the same patterns or relationships in nature This book is a compromise between three competing desiderata It seeks to maximize the generality of the models constrain the models to behave realistically that is to exhibit stability and other features and minimize the difficulty of presentations of the models The ultimate goal of the book is to introduce the reader to the general mathematical tools used in building realistic ecosystem models Just such a model is presented in Chapter Nine The book should also serve as a stepping stone both to advanced mathematical works like Stability of Biological Communities by Yu M Svirezhev and D O Logofet Mir Moscow 1983 and to advanced modeling texts like Freshwater Ecosystems by M Straskraba and A H Gnauch Elsevier Amsterdam 1985 **Mathematical Modeling in Ecology** Clark Jeffries,1989-01-01 Mathematical ecology is the application of mathematics to describe and understand ecosystems There are two main approaches One is to describe natural communities and induce statistical patterns or relationships which should generally occur However this book is devoted entirely to introducing the student to the second approach to study deterministic mathematical models and on the basis of mathematical results on the models to look for the same patterns or relationships in nature This book is a compromise between three competing desiderata It seeks to maximize the generality of the models constrain the models to behave realistically that is to exhibit stability and other features and minimize the difficulty of presentations of the models The ultimate goal of the book is to introduce the reader to the general

mathematical tools used in building realistic ecosystem models Just such a model is presented in Chapter Nine The book should also serve as a stepping stone both to advanced mathematical works like Stability of Biological Communities by Yu M Svirezhev and D O Logofet Mir Moscow 1983 and to advanced modeling texts like Freshwater Ecosystems by M Straskraba and A H Gnauch Elsevier Amsterdam 1985 **Progress in Mathematical Ecology** Sergei Petrovskii,2018-12-07 This book is a printed edition of the Special Issue Progress in Mathematical Ecology that was published in Mathematics Applied Mathematical Ecology Simon A Levin,Thomas G Hallam,Louis J Gross,1989-10-19 Matrices and Graphs Stability Problems in Mathematical Ecology D. Logofet,2018-02-01 Intuitive ideas of stability in dynamics of a biological population community or ecosystem can be formalized in the framework of corresponding mathematical models These are often represented by systems of ordinary differential equations or difference equations Matrices and Graphs covers achievements in the field using concepts from matrix theory and graph theory The book effectively surveys applications of mathematical results pertinent to issues of theoretical and applied ecology The only mathematical prerequisite for using Matrices and Graphs is a working knowledge of linear algebra and matrices The book is ideal for biomathematicians ecologists and applied mathematicians doing research on dynamic behavior of model populations and communities consisting of multi component systems It will also be valuable as a text for a graduate level topics course in applied math or mathematical ecology **Mathematical Ecology of Plant Species Competition** Anthony G. Pakes,Ross A. Maller,1990 Presented in this document is a class of deterministic models describing the dynamics of two plant species whose characteristics are common to the majority of annual plants that have a seedbank Formulated in terms of elementary dynamical systems these models were developed in response to four major questions on the long term outcomes of binary mixtures of plant species Is ultimate coexistence possible If not which strain will win Does the mixture approach an equilibrium If so how long does the mixture take to attain it The book gives a detailed account of model construction analysis and application to field data obtained from long term trials In the particular case study modelled the species involved are two pastural strains whose dynamics have critical agricultural and economic implications for the areas in which they are found including North America the Mediterranean region and Australia This study will be valuable to researchers and students in mathematical biology and to agronomists and botanists interested in population dynamics **Elementary Mathematical Ecology** John Vandermeer,1981-04-20 Introduces the mathematics needed for mathematical ecology Uses a class tested problem solving approach **Mathematical ecology ; 2** ,1989 **Mathematical Ecology** ,198? *Mathematical ecology* E. C. Pielou,1977 **Mathematics for Ecology and Environmental Sciences** Yasuhiro Takeuchi,Yoh Iwasa,Kazunori Sato,2007-01-19 Dynamical systems theory in mathematical biology has attracted much attention from many scientific directions The purpose of this volume is to discuss the many rich and interesting properties of dynamical systems that appear in ecology and environmental sciences The main topics include population dynamics with dispersal nonlinear discrete population dynamics structured population models

mathematical models in evolutionary ecology stochastic spatial models in ecology game dynamics and the chemostat model Each chapter will serve to introduce students and scholars to the state of the art in an exciting area to present important new results and to inspire future contributions to mathematical modeling in ecology and environmental sciences

Mathematical Modelling in Ecology: Unveiling the Intricate Dynamics of Ecosystems Pasquale De Marco,2025-03-09 Mathematical Ecology Unveiling the Intricate Dynamics of Ecosystems is a groundbreaking exploration of the application of mathematics to ecological problems This comprehensive book provides a deep dive into the theoretical foundations practical applications and real world case studies that have shaped the field of mathematical ecology Within its pages readers will embark on a journey through the intricate workings of ecosystems gaining a profound understanding of the factors that drive population dynamics shape community interactions and determine ecosystem functioning Mathematical models are presented as powerful tools for unraveling the complexities of ecological systems providing insights that would otherwise remain hidden From population growth and decline to species coexistence and competitive exclusion Mathematical Ecology delves into the mathematical underpinnings of ecological phenomena It explores the mathematical analysis of food webs energy flow and nutrient cycling revealing the mechanisms that maintain ecosystem stability and resilience This book also delves into the cutting edge frontiers of mathematical ecology showcasing how mathematical models are being used to predict ecosystem responses to environmental change inform conservation and management strategies and address global challenges such as biodiversity loss and climate change With its clear and engaging writing style Mathematical Ecology is an essential resource for ecologists mathematicians and anyone seeking a deeper understanding of the intricate dynamics of ecosystems It is a testament to the power of mathematics as a tool for unlocking the secrets of the natural world If you like this book write a review **Integrodifference Equations in Spatial Ecology** Frithjof Lutscher,2019-10-30 This book is the first thorough introduction to and comprehensive treatment of the theory and applications of integrodifference equations in spatial ecology Integrodifference equations are discrete time continuous space dynamical systems describing the spatio temporal dynamics of one or more populations The book contains step by step model construction explicitly solvable models abstract theory and numerical recipes for integrodifference equations The theory in the book is motivated and illustrated by many examples from conservation biology biological invasions pattern formation and other areas In this way the book conveys the more general message that bringing mathematical approaches and ecological questions together can generate novel insights into applications and fruitful challenges that spur future theoretical developments The book is suitable for graduate students and experienced researchers in mathematical ecology alike Nonlinear Dynamics of Interacting Populations A. D. Bazykin,Aleksandr Iosifovich Khibnik,Bernd Krauskopf,1998 This book contains a systematic study of ecological communities of two or three interacting populations Starting from the Lotka Volterra system various regulating factors are considered such as rates of birth and death predation and competition The different factors can have a stabilizing

or a destabilizing effect on the community and their interplay leads to increasingly complicated behavior Studying and understanding this path to greater dynamical complexity of ecological systems constitutes the backbone of this book On the mathematical side the tool of choice is the qualitative theory of dynamical systems most importantly bifurcation theory which describes the dependence of a system on the parameters This approach allows one to find general patterns of behavior that are expected to be observed in ecological models Of special interest is the reaction of a given model to disturbances of its present state as well as to changes in the external conditions This leads to the general idea of dangerous boundaries in the state and parameter space of an ecological system The study of these boundaries allows one to analyze and predict qualitative and often sudden changes of the dynamics a much needed tool given the increasing antropogenic load on the biosphere As a spin off from this approach the book can be used as a guided tour of bifurcation theory from the viewpoint of application The interested reader will find a wealth of intriguing examples of how known bifurcations occur in applications The book can in fact be seen as bridging the gap between mathematical biology and bifurcation theory   Mathematical Models for Communicable Diseases Fred Brauer,Carlos Castillo-Chavez,2013-02-07 A self contained and comprehensive guide to the mathematical modeling of disease transmission appropriate for graduate students
