Decisions, Uncertainty, and the Brain Paul W. Glimcher,2004-09-17 In this provocative book Paul Glimcher argues that economic theory may provide an alternative to the classical Cartesian model of the brain and behavior Glimcher argues that Cartesian dualism operates from the false premise that the reflex is able to describe behavior in the real world that animals inhabit A mathematically rich cognitive theory he claims could solve the most difficult problems that any environment could present eliminating the need for dualism by eliminating the need for a reflex theory Such a mathematically rigorous description of the neural processes that connect sensation and action he explains will have its roots in microeconomic theory Economic theory allows physiologists to define both the optimal course of action that an animal might select and a mathematical route by which that optimal solution can be derived Glimcher outlines what an economics based cognitive model might look like and how one would begin to test it empirically Along the way he presents a fascinating history of neuroscience He also discusses related questions about determinism free will and the stochastic nature of complex behavior

Vlek,1975-12-31 Human decision making involves problems which are being studied with increasing interest and sophistication They range from controversial political decisions via individual consumer decisions to such simple tasks as signal discriminations Although it would seem that decisions have to do with choices among available actions of any kind there is general agreement that decision making research should pertain to choice problems which cannot be solved without a predecisional stage of finding choice alternatives weighing evidence and judging values The ultimate objective of scientific research on decision making is two fold a to develop a theoretically sound technology for the optimal solution of decision problems and b to formulate a descriptive theory of human decision making The latter may in turn protect decision makers from being caught in the traps of their own limitations and biases Recently in decision making research the strong emphasis on well defined laboratory tasks is decreasing in favour of more realistic studies in various practical settings This may well have been caused by a growing awareness of the fact that decision behaviour is strongly determined by situational factors which makes it necessary to look into processes of interaction between the decision maker and the relevant task environment Almost inevitably there is a parallel shift of interest towards problems of utility measurement and the evaluation of consequences **How Do You Know?** Holly Hirst,James R.
