

Equation (7):

$$\begin{aligned} A_{2i} &= A_{2i-1} & i &= 1 \rightarrow n \\ A_{2,i+1} &= L(s)C_{2i} & i &= 2 \rightarrow n, i = 1 \rightarrow n \end{aligned}$$

where

$$C_{2i} = A_{2i-1,i-1} + A_{2i-1,i}[B(I_n)w_i - w_{i-1}e^{j\omega T-1}] + w_i$$

Note that the above equations have also been slightly simplified and corrected for an index error within the square brackets.

Preliminary numerical work has shown that the above method can be many times faster than the iterative solution.¹ A full report is being prepared.

Matrix Methods in Urban and Regional Analysis—Andrew Rogers (San Francisco, Calif.: Holden-Day, 1971, 508 pp., \$24.95). Reviewed by Louis F. Kudva.

Louis F. Kudva received the B.S. and M.S.E. degrees in electrical engineering from the University of Cincinnati, Cincinnati, Ohio, in 1959 and 1961, respectively, and the Ph.D. in electrical engineering from Syracuse University, Syracuse, N. Y., in 1965. He is currently Professor of Electrical and Computer Engineering at the University of Michigan, Ann Arbor. From 1965 to 1967 he served as Chairman of IEEE Group on Automatic Control. His current research interests are in the application of systems theory to societal system problems.

The title of this book accurately describes its contents. This book is an outgrowth of the author's experience in teaching courses in urban and regional analysis where he found that in order to cover the field adequately a wide range of analytical topics had to be covered. Unsurprisingly of the subject matter revealed the underlying analytical theme to be matrix algebra. Considerable structural identity was identified in diverse problems once a problem was put in a matrix format. This book, therefore, is directed toward developing a common methodology for the analysis of regional and urban problems. In so doing, the author has attempted to put under one cover most of the mathematical techniques currently used by economists, engineers, geographers, and sociologists in the quantitative analysis of societal system problems. Under the supposition that nonphysical scientists may be deficient in mathematics, the author states "the basic prerequisite for comprehending most of the topics discussed in this book is high school algebra." Based on this postulate all the mathematical techniques are introduced in a noncomplicated manner.

Chapter 1 introduces the reader to the basic concepts of matrices

and elementary matrix operations. The various matrix concepts are introduced by simple examples and word explanations. These are followed by "the general case." To give the reader some motivation and a better understanding of the mathematical operations presented, they are immediately applied to three societal problems.

- 1) Analysis of interregional population.
- 2) Geographical distribution of human activities.
- 3) Input-output analysis of the Yugoslavian Economy.

Throughout the book the author utilizes these three problem areas in order to demonstrate a new operation or method.

In Chapter 2 the inverse of a square matrix is studied. In order to perform the inverse operation the concept of a determinant is needed and is therefore introduced. Using this as a vehicle matrix inversion by the method of determinants is given. This is followed by a discussion of matrix inversion by the method of successive transformations, and power series expansion of the inverse matrix. These new operations are applied to the three "real world" example situation of Chapter 1 given above.

Up to this point in the book the author has the reader completely convinced that matrix methods make the analysis of a many variable problem much simpler. However, turning the page reveals an "Appendix Programming Matrix Operation in FORTRAN." To the reviewer this seems like a violent discontinuity in the text material. Why it was not put at the end of the book, it's hard to say. For a reader not familiar with FORTRAN, the material presented is insufficient for him to do programming, and since almost all digital systems have matrix routines available, this material adds little direct value to the contents of the book.

Chapter 3 introduces regression analysis. This subject has been the forte of demographic analysis. It seems that at this point the

This volume is devoted to the geographical or spatial aspects of population research in regional science spanning spatial demographic methods for population composition and migration to studies of internal and international migration to investigations of the role of population in related fields such as climate change and economic growth. If spatial aspects of economic growth and development are the flagship of the regional science discipline, population research is the anchor. People migrate, consume, produce and demand services. People are the source and beneficiaries of national, regional and local growth and development. Since the origins of regional science, demographic research has been at the core of the discipline. Contributions in this volume are both retrospective and prospective, offering in their ensemble an authoritative overview of demographic research within the field of regional science.

Urban Systems (Routledge Revivals) C. S. Bertuglia, G. Leonardi, S. Occelli, G. A. Rabino, R. Tadei, Alan Wilson, 2013-10-18. This edited collection, first published in 1987, provides a comparative analysis of different approaches to urban modelling and lays the foundations for the possibility of integration and a more unified field. The first part contextualises the development of the field of urban systems modelling, focusing on the variety of approaches and possible implications of this on the future of research and methodology. Next, the editors consider economic and non-economic approaches, followed by an analysis of spatial interaction-based approaches. Providing an overview to the field and research literature, the overarching argument is that there should be an integrated methodological approach to urban system modelling.

Energy Systems Analysis for Developing Countries P. Meier, 2012-12-06. The lecture notes presented in these pages were originally developed for use in the Energy Management Training Program (EMTP) sponsored by the Office of Energy, U.S. Agency for International Development. This program, held at Brookhaven National Laboratory, BNL, and the Institute for Energy Research, State University of New York at Stony Brook, is designed to train mid-career and senior government officials in developing countries in the techniques of energy policy analysis and planning and covers, in addition to the material presented here, more detailed case studies in resource evaluation, pricing, conservation, financial analysis and investment planning. Since its inception in 1978, some 220 individuals from 57 countries have attended the course. These notes have also been used in executive level seminars and in country training programs in the Sudan, the Dominican Republic and the People's Republic of China. Attendance at the course is diverse and typically includes planners, managers, engineers and economists from energy planning agencies, ministries of finance and economic development, electric utilities, refineries and State Oil Companies, and specialized energy planning units for energy conservation and for regional cooperation. The monograph is designed not just as reading material to support lectures but also as a general self-contained reference text for a very diverse audience; we have therefore included much introductory material. The presentation is focused on a discussion of the basic principles of systems analysis, and the case material has been specially designed to illustrate these principles.
