Metal Carcinogenesis Testing:

Metal Carcinogenesis Testing Max Costa, 2008-02-07 Metal Carcinogenesis Testing explains fundamental principles of metal carcinogenesis as they are currently understood and provides detailed practical descriptions of rapid and inexpensive in vitro assay methodology presently in use for the detection of potentially carcinogenic metals and their compounds. Mounting experimental evidence has suggested that a number of metals and their compounds are potentially carcinogenic to humans. Since humans are exposed to these potentially carcinogenic metals in industrial situations and through environmental pollution it is essential that experimental protocols be available to identify the specific metal compounds that are potentially carcinogenic. This book affords a thorough description of the various carcinogenesis test systems available for metals centering on those that are rapid, inexpensive and most reliable. The principles are discussed at the level of human exposure, of animal studies and of research in vitro. Additionally the molecular mechanisms of metal induced cancer are considered at each of these three levels. In large part the emphasis rests on the use of in vitro biochemical and bacterial studies including tissue culture because these methods are the basis of the rapid and inexpensive screening of potentially carcinogenic substances.

Carcinogenicity of Metals Alan B. G. Lansdown, 2013-10-31 This book re-evaluates epidemiological and occupational health studies, experimental studies in animals and in vitro experiments relating to the toxicity of 27 metal and metalloid elements for which evidence of carcinogenicity has been presented. Human carcinogenic risk is substantiated in relation to arsenic, beryllium, thorium, chromium, radioactive elements, probably lead and some nickel and cobalt compounds and respirable silica particles but the carcinogenicity of iron, aluminium, titanium, tungsten, antimony, bismuth, mercury, precious metals and certain related compounds in humans is unresolved. The toxicity and carcinogenicity of each element is specific but correlates poorly with its position in the Periodic Table. Carcinogenicity differs according to the valency of the ion and its ability to interact with and penetrate membranes in target cells and to bind, denature or induce mutations by genotoxic or epigenetic mechanisms. This important text comprehensively examines each of the elements providing detailed information on the carcinogenicity and toxicity and detailing the most up to date research in this area. The book is an essential tool for toxicologists, medicinal and biochemists and environmental scientists working in both industry and academia.

Carcinogenic and Mutagenic Metal Compounds E. Merian, 1985 This book contains selected papers presented at the Third Hans Wolfgang Nurnberg Memorial Workshop on Toxic Metal compounds held in Follonica, Italy, in April 1988. This workshop discussed the areas of research which link chemistry and biology, defining real problems for further research and was attended by experts from different fields including analytical chemistry, speciation, environmental chemistry, biochemistry, short term testing and risk assessment.
