Methods For Analysis Of Nonlinear Elliptic Boundary Value Problems:

Methods for Analysis of Nonlinear Elliptic Boundary Value Problems I. V. Skrypnik, 1994-01-01 The theory of nonlinear elliptic equations is currently one of the most actively developing branches of the theory of partial differential equations This book investigates boundary value problems for nonlinear elliptic equations of arbitrary order In addition to monotone operator methods a broad range of applications of topological methods to nonlinear differential equations is presented solvability estimation of the number of solutions and the branching of solutions of nonlinear equations Skrypnik establishes by various procedures a priori estimates and the regularity of solutions of nonlinear elliptic equations of arbitrary order Also covered are methods of homogenization of nonlinear elliptic problems in perforated domains The book is suitable for use in graduate courses in differential equations and nonlinear functional analysis

Boundary Value Problems for Nonlinear Elliptic Equations in Divergence Form Abubakar Mwasa, 2021-02-23 The thesis consists of three papers focussing on the study of nonlinear elliptic partial differential equations in a nonempty open subset of the n dimensional Euclidean space $\mathbb{R}^n$ We study the existence and uniqueness of the solutions as well as their behaviour near the boundary of The behaviour of the solutions at infinity is also discussed when is unbounded In Paper A we consider a mixed boundary value problem for the p Laplace equation $\operatorname{div} u = 0$ in an open infinite circular half cylinder with prescribed Dirichlet boundary data on a part of the boundary and zero Neumann boundary data on the rest By a suitable transformation of the independent variables this mixed problem is transformed into a Dirichlet problem for a degenerate weighted elliptic equation on a bounded set By analysing the transformed problem in weighted Sobolev spaces it is possible to obtain the existence of continuous weak solutions to the mixed problem both for Sobolev and for continuous data on the Dirichlet part of the boundary A characterisation of the boundary regularity of the point at infinity is obtained in terms of a new variational capacity adapted to the cylinder In Paper B we study Perron solutions to the Dirichlet problem for the degenerate quasilinear elliptic equation $\operatorname{div} A(x) \nabla u = 0$ in a bounded open subset of $\mathbb{R}^n$ The vector valued function A satisfies the standard ellipticity assumptions with a parameter $1 < p$ and a p admissible weight w For general boundary data the Perron method produces a lower and an upper solution and if they coincide then the boundary data are called resolute We show that arbitrary perturbations on sets of weighted p capacity zero of continuous and quasicontinuous Sobolev boundary data f are resolute and that the Perron solutions for f and such perturbations coincide As a consequence it is also proved that the Perron solution with continuous boundary data is the unique bounded continuous weak solution that takes the required boundary data outside a set of weighted p capacity zero Some results in Paper C are a generalisation of those in Paper A extended to quasilinear elliptic equations of the form $\operatorname{div} A(x) \nabla u = 0$ Here results from Paper B are used to prove the existence and uniqueness of continuous weak solutions to the mixed boundary value problem for continuous Dirichlet data Regularity of the boundary point at infinity for the equation $\operatorname{div} A(x) \nabla u = 0$ is characterised by a Wiener type criterion We show that sets of Sobolev p capacity zero are

removable for the solutions and also discuss the behaviour of the solutions at In particular a certain trichotomy is proved similar to the Phragmén Lindelöf principle

Analysis of a Parallelized Nonlinear Elliptic Boundary Value Problem Solver with Application to Reacting Flows Institute for Computer Applications in Science and Engineering, David E. Keyes, 1987

Convex Analysis and Nonlinear Geometric Elliptic Equations Ilya J. Bakelman, 2012-12-06 Investigations in modern nonlinear analysis rely on ideas methods and problems from various fields of mathematics mechanics physics and other applied sciences In the second half of the twentieth century many prominent exemplary problems in nonlinear analysis were subject to intensive study and examination The united ideas and methods of differential geometry topology differential equations and functional analysis as well as other areas of research in mathematics were successfully applied towards the complete solution of complex problems in nonlinear analysis It is not possible to encompass in the scope of one book all concepts ideas methods and results related to nonlinear analysis Therefore we shall restrict ourselves in this monograph to nonlinear elliptic boundary value problems as well as global geometric problems In order that we may examine these problems we are provided with a fundamental vehicle The theory of convex bodies and hypersurfaces In this book we systematically present a series of centrally significant results obtained in the second half of the twentieth century up to the present time Particular attention is given to profound interconnections between various divisions in nonlinear analysis The theory of convex functions and bodies plays a crucial role because the ellipticity of differential equations is closely connected with the local and global convexity properties of their solutions Therefore it is necessary to have a sufficiently large amount of material devoted to the theory of convex bodies and functions and their connections with partial differential equations

Homogenization of Partial Differential Equations Vladimir A. Marchenko, Evgueni Ya. Khruslov, 2008-12-22

Homogenization is a method for modeling processes in microinhomogeneous media which are encountered in radiophysics filtration theory rheology elasticity theory and other domains of mechanics physics and technology These processes are described by PDEs with rapidly oscillating coefficients or boundary value problems in domains with complex microstructure From the technical point of view given the complexity of these processes the best techniques to solve a wide variety of problems involve constructing appropriate macroscopic homogenized models The present monograph is a comprehensive study of homogenized problems based on the asymptotic analysis of boundary value problems as the characteristic scales of the microstructure decrease to zero The work focuses on the construction of nonstandard models non local models multicomponent models and models with memory Along with complete proofs of all main results numerous examples of typical structures of microinhomogeneous media with their corresponding homogenized models are provided Graduate students applied mathematicians physicists and engineers will benefit from this monograph which may be used in the classroom or as a comprehensive reference text
