Fundamentals of Computational Geoscience Chongbin Zhao, Bruce E. Hobbs, Alison Ord, 2009-04-21 Geoscience is a fundamental natural science discipline dealing with the origin evolutionary history and behaviour of the planet Earth As a result of its complicated and complex nature the Earth system not only provides the necessary materials and environment for mankind to live but also brings many types of natural disasters such as earthquakes volcanic eruptions tsunamis oods and tornadoes to mention just a few With the ever increasing demand for improving our living standards it has been recognized that the existing natural resources will be exhausted in the near future and that our living environments are in fact deteriorating To maintain the sustainable development of our living standards and the further improvement of our living environments an inevitable and challenging task that geoscientists are now confronting is how accurately to predict not only the occurrences of these natural disasters but also the locations of large concealed natural resources in the deepEarth For this reason geoscientists must study the processes rules and laws by which the Earth system operates instead of simply describing and observing g science phenomena **MATLAB® Recipes for Earth Sciences** Martin Trauth, 2010-06-26

Parthasarathi Ghosh, 2010-08 Understanding earth systems and its dynamic behavior requires objective insights into the complex observational data sets and their interrelationships Drawing meaningful inferences from such data is not always an easy task as the deterministic relationships between various geological variables often remain obscured These

interrelationships need to be determined empirically through the analysis of a large set of data and validated through numerical simulations. The ever widening horizon of techniques of numerical analysis and simulation now provides a good number of tools to aid the interpretation. However, due to the inherent complexity of earth science data, expert supervision is required at all stages of analysis from collection to dissemination. This ensures that the most appropriate methodology is adopted and the results remain consistent with the geological principles. Discussions on these practical issues often lie beyond the scope of textbooks and this is precisely where this book is placed. In this book, eminent geoscientists present their experiences in analyzing and managing earth science data as well as in designing numerical models to simulate earth processes. Apart from giving a discourse of their own approach towards a particular research problem, they also discuss at length the relative merits of alternative methodologies. These seven authoritative articles, richly illustrated, will be a valuable resource for research students and professionals interested in research and teaching in various branches of earth science like tectonics, GPS, geodesy, sedimentology, geographical information science, and evolutionary biology.

Python Recipes for Earth Sciences Martin H. Trauth, 2024-10-07 Python is used in a wide range of geoscientific applications such as in processing images for remote sensing, in generating and processing digital elevation models, and in analyzing time series. This book introduces methods of data analysis in the geosciences using Python that include basic statistics for univariate, bivariate, and multivariate data sets; time series analysis; and signal processing; the analysis of spatial and directional data; and image analysis. The text includes numerous examples that demonstrate how Python can be used on data sets from the earth sciences. Codes are available online through GitHub.

MATLAB® Recipes for Earth Sciences Martin H. Trauth, 2020-12-02 MATLAB is used in a wide range of geoscientific applications, e.g., for image processing in remote sensing, for creating and processing digital elevation models, and for analyzing time series. This book introduces readers to MATLAB-based data analysis methods used in the geosciences, including basic statistics for univariate, bivariate, and multivariate datasets; time series analysis; signal processing; the analysis of spatial and directional data; and image analysis. The revised and updated Fifth Edition includes seven new sections, and the majority of the chapters have been rewritten and significantly expanded. New sections include error analysis; the problem of classical linear regression of log-transformed data; aligning stratigraphic sequences; the Normalized Difference Vegetation Index; Aitchison's log-ratio transformation; graphical representation of spherical data; and statistics of spherical data. The book also includes numerous examples demonstrating how MATLAB can be used on datasets from the earth sciences. The supplementary electronic material available online through SpringerLink contains recipes that include all the MATLAB commands featured in the book and the sample data.

Forensic Geoscience Kenneth Pye, Debra J. Croft, 2004 Forensic geoscience is an increasingly important sub discipline within geoscience and forensic science Although minerals soils dusts and rock fragments have been used as only begun to be recognized in the last ten years or so The police and other investigative bodies are keen to encourage such developments in

the fight against crime particularly since many criminals show a high level of forensic awareness with regard to evidence such as fingerprints blood and other body fluids The papers in this volume illustrate some of the main principles techniques and applications in current forensic geoscience covering research and casework in the UK and internationally The techniques described range from macro scale field geophysical investigations to micro scale laboratory studies of the chemical and textural properties of individual particles In addition to forensic applications many of these techniques have broad utility in geological geomorphological soil science and archaeological research
