Regolith Soils And Landforms:

Regolith, Soils and Landforms Cliff Ollier, Colin Pain, 1996-05 Regolith is the layer of broken and unconsolidated rock and soil material that forms the surface of the land and covers the bedrock nearly everywhere An understanding of its properties and structure is very important in topics such as groundwater supply soil conservation and exploration efforts for economic materials Regolith Soils and Landforms is a manual for students professionals and researchers concerned with the practical examination and analysis of earth surface materials in the field The text describes many economic aspects of regolith studies such as the formation of mineral deposits the importance of weathering zones and how the chemistry of regolith affects human health Presenting a new view of the geological history of the earth it places emphasis on the formation and destruction of regolith materials and provides a challenge for established concepts in landscape evolution It will be an essential text to a wide range of readership including students of Geology Geomorphology Geography Agriculture and Engineering as well as professionals dealing with regolith in their own work *Regolith Science* Keith Scott, Colin Pain, 2009-08-18 This comprehensive reference on the fundamentals of regolith geoscience describes how regolith is developed from parental rocks and emphasises the importance of chemical physical water and biological processes in regolith formation It provides details for mapping regolith landforms as well as objective information on applications in mineral exploration and natural resource management Regolith Science also provides a concise history of weathering through time in Australia It includes previously unpublished information on elemental abundances in regolith materials along with detailed information on soil degradation processes such as acid sulfate soils Written by experts in the field Regolith Science summarises research carried out over a 13 year period within the Cooperative Research Centre for Landscape Environments and Mineral Exploration This book will be a valuable resource for scientists and graduate postgraduate students in geology geography and soil science professionals in the exploration industry and natural resources management This paperback edition is a reprint of the original hardback published in October 2008 **Guidelines for Surveying Soil and Land Resources** Neil McKenzie, 2008 Provides guidelines to promote the development and implementation of consistent methods and standards for conducting soil and land resource surveys in Australia *Geoenvironmental Mapping: Methods, Theory and Practice* Peter T Bobrowsky, 2001-01-01 This text illustrates the range of environmental geoscience mapping presently carried out around the world Specialists in several countries have contributed a number of subdisciplinary and thematic topics including volcanic hazards landslides dolines tsunamis radon potential medical geology rainfall erosion engineering geology borehole stratigraphy lake sediment geochemistry aggregate resources and remote sensing The collection analysis and interpretation of data by geologists geographers and engineers typically involves the presentation of information in map form which can range from black white to colour 2 D to 3 D and paper copy to digital format illustrations This volume reaffirms the global need for mapping geoscientific data **Fundamentals of Geomorphology** Richard John

Human Activities and the Tropical Rainforest Bernard K. Maloney, 2013-11-11 Arising initially from a conference the papers published here have been integrated into book form to provide information on human activities and the tropical rainforest in the past and present and on the possible future of the rainforest in a unique way Other books have considered some but not all of these themes however none has stressed the continuity of change over time and its possible outcome for the people of the forest as well as for the forest itself Because of the approach taken this book should appeal across traditional disciplinary boundaries Indeed a prime aim has been to suggest that rainforest because of its complexity

and the complexity of people rainforest relationships throughout time deserves study from a broad perspective This book poses more questions than answers about the rainforest and it is hoped that it will encourage readers to think about the rainforest in a wider way than hitherto This book is aimed at geographers physical and human social anthropologists archaeologists pedologists foresters and tropical botanists and will be of value to graduates of various disciplines setting out to research the rainforest

Pedodiversity Juan José Ibáñez, James G. Rocks and Landforms John Gerrard, 2012-12-06 Geomorphology can be defined simply as the study of landforms Landforms are the result of the interaction between what Ritter 1978 has called the driving and resisting forces The driving forces or processes are the methods by which energy is exerted on earth materials and include both surface geomorphological or exogenous processes and subsurface geological or endogenous processes The resisting forces are the surface materials with their inherent resistances determined by a complex combination of rock properties Stated in these simple terms it would be expected that both sides of the equation be given equal weight in syntheses of landform evolution However this has not been the case Until about the 1950s geomorphology was mainly descriptive and concerned with producing time dependent models of landscape evolution Although the form of the land was the main focus there was little detailed mention of process and scant attention to the properties of surface materials There were of course exceptions In the late 19th century G K Gilbert was stressing the equilibrium between landforms and processes Many hydrologists were examining the detailed workings of river systems and drainage basins culminating in the classic paper of Horton 1945
