Lubrecht,2000-07-21 Efficient numerical solution of realistic and therefore complex equation systems occupies many
researchers in many disciplines For various reasons but mainly in order to approximate reality a very large number of
unknowns are needed Using classical techniques the solution of such a system of equations would take too long and so
sometimes MultiLevel techniques are used to accelerate convergence Over the last one and a half decades the authors have
studied the problem of Elastohydrodynamic Lubrication governed by a complex integro differential equation Their work has
resulted in a very efficient and stable solver In this book they describe the different intermediate problems analyzed and
solved and how those ingredients finally come together in the EHL solver A number of these intermediate problems such as
Hydrodynamic Lubrication and Dry Contact are useful in their own right In the Appendix the full codes of the Poisson
problem the Hydrodynamic Lubrication problem the dry contact solver and the EHL solver are given These codes are all
