Third-Generation Neuroimaging: Translating Research into Clinical Utility André Schmidt,Stefan Borgwardt,2016-11-02 Psychiatric imaging needs to move away from simple investigations of the neurobiology underling the early phases of psychiatric diseases to translate imaging findings in the clinical field targeting clinical outcomes including transition remission and response to preventative interventions This research topic aims to bring

psychiatric neuroimaging studies towards translational impacts in clinical practice suggesting that brain abnormalities may be of potential use for detecting clinical outcomes as treatment response First generation psychiatric neuroimaging focused on simple structural brain alterations associated with the neurobiology of the illness These early studies adopted imaging methods mainly including computerized tomography CT to investigate brain size Second generation psychiatric neuroimaging studies benefited from more sophisticated techniques which included structural methods sMRI coupled with whole brain automated methods voxel based morphometry VBM white matter methods diffusion tensor imaging DTI and tractography functional methods functional magnetic resonance imaging fMRI and advanced neurochemical imaging PET techniques addressing receptor bindings and pre post synaptic functions magnetic resonance spectroscopy MRS and sophisticated meta analytical imaging methods However no consistent or reliable anatomical or functional brain alterations have been univocally associated with any psychiatric disorder and no clinical applications have been developed in psychiatric neuroimaging There is thus urgent need of psychiatric imaging to move towards third generation paradigms In this research topic these novel neuroimaging studies here requested to move away from simple investigations of the neurobiology to translate imaging findings in the clinical field targeting longitudinal outcomes including transition remission and response to preventative interventions With respect to methods the most recent neuroimaging approaches e g structural and functional MRI EEG DTI spectroscopy PET are welcome Third generation psychiatric imaging studies including multimodal approaches multi center analyses mega analyses effective connectivity dynamic causal modelling support vector machines structural equation modelling or graph theory analysis are highly appreciated Furthermore these third generation imaging studies may benefit from the incorporation of new sources of neurobiological information such as whole genome sequencing proteomic lipidomic and expression profiles and cellular models derived from recent induced pluripotent stem cells research We collect Original Research Reviews Mini Reviews Book Review Clinical Case Study Clinical Trial Editorial General Commentary Hypothesis Theory Methods Mini Opinion Perspective and Technology Report from international researcher and clinicians in this field The purpose of this research topic is intended to provide the field with current third generation neuroimaging approaches in translational psychiatry that is hoped to improve and create therapeutic options for psychiatric diseases

Oscillatory “Temporal Sampling” and Developmental Dyslexia: Towards an Over-Arching Theoretical Framework Usha Goswami, Alan Power, Marie Lallier, Andrea Facioetti,2015-04-01

Children with developmental dyslexia fail to acquire efficient reading and spelling skills despite adequate tuition and an absence of overt sensory and or neural deficits Learning to read and spell requires linguistic skills auditory skills and visual skills Oscillatory temporal sampling theory links the development of sensory and linguistic processes The auditory system samples acoustic information at different temporal rates which for speech processing suggests that temporal information encoded by delta theta and gamma oscillations is bound together in the final speech percept Temporal sampling theory proposed a possible deficit in dyslexia in auditory sampling of the speech signal at syllable relevant rates 10 Hz delta and theta This would hypothetically affect prosodic development prior to reading and syllable based parsing which would affect efficient linguistic skills and consequently reading development across languages The visual system also samples information in the visuo spatial field In theory atypical visual oscillatory sampling could therefore be related to some of the visual features of developmental dyslexia In this special issue we bring together visual and auditory sensory processing studies around the general theme of oscillatory temporal sampling Contributors were encouraged to discuss their findings within a temporal sampling perspective The resulting studies cover a wide range of sensory processes with findings both supporting and contradicting the theory It is also important to note that studies covered a wide range of languages and that the behavioural manifestations of a sampling

impairment may differ both with language and over the course of development Nevertheless it is encouraging to see such diverse findings considered within a single theoretical framework even if at the same time it is apparent that an over arching theoretical framework encompassing both visual and auditory deficits in dyslexia is yet to be achieved *Mapping psychopathology with MRI and connectivity analysis* Long-Biao Cui,Min Cai,Baojuan Li,Hua-ning Wang,Yongbin Wei,Hong Yin,2023-03-07
