Special relativistic hydrodynamics

2.1 Perfect fluid energy momentum tensor

It is easiest to begin a study of general relativistic hydrodynamics with a discussion of special relativistic hydrodynamics in flat space. A good starting point for any hydrodynamic discussion is the energy momentum tensor. Many astrophysical and cosmological models make use of the hydrodynamics of a perfect fluid. A perfect fluid is simply one in which the velocity field at each point is such that an observer moving with this velocity sees the fluid as isotropic and nonviscous on a small enough local scale. Although we begin our discussion with a perfect fluid, we will add imperfections (viscosity, heat flow, etc.) later.

The stress tensor in Newtonian fluids is a measure of the momentum flux. In relativity (both special and general) one desires a generalization to a measure of not only momentum flux density, but also energy flux density and energy density as observed in different reference frames. In special relativity it is easy to find the form of the energy momentum tensor. Consider a pressureless cloud consisting of a local number density of n particles per unit volume with a rest mass of m_0 each. An observer in an arbitrary frame then measures a fluid mass energy density,

$$\text{mass energy density} = \sum_n \frac{n m_0}{(1 - v^2)}. \quad (2.1)$$

where one factor of $1/\sqrt{1 - v^2}$ arises from length contraction and another factor from the mass energy. In special relativity, this quantity represents the flux of mass energy across a $t = \text{constant}$ surface. The energy flux density across a spatial surface is the amount of energy transported in various directions as seen by the observer,

$$(\text{energy flux density})_i = (\text{momentum density})_i = \sum_n \frac{n m_0 v^i}{(1 - v^2)}. \quad (2.2)$$

Relativistic Hydrodynamics Luciano Rezzolla,Olindo Zanotti,2013-09-26 Relativistic hydrodynamics is a very successful theoretical framework to describe the dynamics of matter from scales as small as those of colliding elementary particles up to the largest scales in the universe This book provides an up to date lively and approachable introduction to the mathematical formalism numerical techniques and applications of relativistic hydrodynamics The topic is typically covered either by very formal or by very phenomenological books but is instead presented here in a form that will be appreciated both by students and researchers in the field The topics covered in the book are the results of work carried out over the last 40 years which can be found in rather technical research articles with dissimilar notations and styles The book is not just a collection of scattered information but a well organized description of relativistic hydrodynamics from the basic principles of statistical kinetic theory down to the

technical aspects of numerical methods devised for the solution of the equations and over to the applications in modern physics and astrophysics Numerous figures diagrams and a variety of exercises aid the material in the book The most obvious applications of this work range from astrophysics black holes neutron stars gamma ray bursts and active galaxies to cosmology early universe hydrodynamics and phase transitions and particle physics heavy ion collisions It is often said that fluids are either seen as solutions of partial differential equations or as wet Fluids in this book are definitely wet but the mathematical beauty of differential equations is not washed out *Numerical Relativity* Thomas W. Baumgarte, Stuart L. Shapiro, 2010-06-24 Aimed at students and researchers entering the field this pedagogical introduction to numerical relativity will also interest scientists seeking a broad survey of its challenges and achievements Assuming only a basic knowledge of classical general relativity the book develops the mathematical formalism from first principles and then highlights some of the pioneering simulations involving black holes and neutron stars gravitational collapse and gravitational waves The book contains 300 exercises to help readers master new material as it is presented Numerous illustrations many in color assist in visualizing new geometric concepts and highlighting the results of computer simulations Summary boxes encapsulate some of the most important results for quick reference Applications covered include calculations of coalescing binary black holes and binary neutron stars rotating stars colliding star clusters gravitational and magnetorotational collapse critical phenomena the generation of gravitational waves and other topics of current physical and astrophysical significance

Numerical Special Relativistic Hydrodynamics Weili Zhang, 1996 *Relativistic Astrophysics* Harald Riffert, Hanns Ruder, Hans-Peter Nollert, Friedrich W. Hehl, 2013-06-29 This book summarizes the lectures given at the 162 WE Heraeus Seminar which took place in the house of the German Physical Society in Bad Honnef in August 1996 Already the number 162 shows the activity and effectiveness of the WE Heraeus Foundation We would like to express our thanks to Jutta Adam and Dr Volker Schafer for the almost incredibly simple and unbureaucratic procedure of funding organization and realization and of course to the founders Similar to the 152 WE Heraeus Seminar Relativity and Scientific Computing Springer Verlag 1996 this seminar was a joint venture of the Astronomical Society AG and of the Section Gravitation und Relativity Theory of the German Physical Society DPG Since Einstein has developed his Theory of General Relativity more than 80 years ago the situation has changed dramatically In the first decades main efforts were undertaken for a better understanding and for the experimental verification of the theory Mean while General Relativity GR is one of the experimentally best confirmed theories with 13 an accuracy better than 10 Consequently GR has become a powerful tool for the investigation of cosmic processes where strong gravitational fields are involved The state of the art of our knowledge is summarized by Jürgen Ehlers in the first chapter An impressive example of the change of the situation is the gravitational light deflection **Hyperbolic Problems: Theory, Numerics, Applications** Sylvie Benzoni-Gavage, Denis Serre, 2008-01-12 This volume contains papers that were presented at HYP2006 the eleventh international Conference on Hyperbolic Problems Theory Numerics and
