Nathalie Peyrard, Olivier Gimenez

Modeling Spatiotemporal Dynamics In Ecology:

Modeling Spatiotemporal Dynamics in Ecology Jordi Bascompte, Ricard V. Sole, 1998 Throughout its history ecology has largely been a descriptive science Scientists are in need of a theoretical framework that will assist in the understanding of observed patterns and will serve as a predictive tool Since ecological systems are dynamic and spatially extended it is particularly important to understand the processes underlying spatiotemporal patterns This book reviews one of the newest and most important areas of theoretical ecology the study of spatiotemporal dynamics by means of a spatially explicit approximation that allows the investigation of the effects of real space **Metapopulation Ecology** Ilkka

Hanski, 1999-03-18 Written by a world renowned biologist this volume offers a comprehensive synthesis of current research in this rapidly expanding area of population biology It covers both the essential theory and a wide range of empirical studies including the author's groundbreaking work on the Glanville fritillary butterfly It also includes practical applications to conservation biology The book describes theoretical models for metapopulation dynamics in highly fragmented landscapes and emphasizes spatially realistic models It presents the incidence function model and includes several detailed examples of its application Accessible to advanced undergraduate and graduate students Metapopulation Ecology will be a valuable resource for researchers in population biology conservation biology and landscape ecology **Modelling Environmental**

Dynamics Martin Paegelow, María Teresa Camacho Olmedo, 2008-07-16 Modelling environmental dynamics is critical to understanding and predicting the evolution of the environment in response to the large number of influences including urbanisation climate change and deforestation Simulation and modelling provide support for decision making in environmental management The first chapter introduces terminology and provides an overview of methodological modelling approaches which may be applied to environmental and complex dynamics Based on this introduction this book illustrates various models applied to a large variety of themes deforestation in tropical regions fire risk natural reforestation in European mountains agriculture biodiversity urbanism climate change and land management for decision support etc These case studies provided by a large international spectrum of researchers and presented in a uniform structure focus particularly on methods and model validation so that this book is not only aimed at researchers and graduates but also at professionals **Spatial Modelling in Forest Ecology and Management** Martin Jansen, Michael Judas, Joachim

Saborowski, 2012-12-06 At the end of the 1970s when signs of destabilization of forests became visible in Europe on a large scale it soon became obvious that the syndrome called forest decline was caused by a network of interrelated factors of abiotic and biotic origin All attempts to explain the wide spread syndrome by a single cause and there were many of them failed or can only be regarded as a single mosaic stone in the network of causes behind the phenomenon Forest ecosystems are highly complex natural or quasi natural systems which exhibit different structures and functions and as a consequence different resilience to internal or external stresses Moreover forest ecosystems have a long history which means that former

impacts may act as predisposing factors for other stresses The complexity and the different history of forest ecosystems are two reasons that make it difficult to assess the actual state and future development of forests But there are two other reasons one is the large time scale in which forests react the other is the idiosyncrasy of the reactions on different sites Due to the slow reaction and the regional complexity of the abiotic environment of forest ecosystems a profound analysis of each site and region is necessary to identify the underlying causes and driving forces when attempting to overcome the destruction of forest ecosystems

Self-Organization in Complex Ecosystems Ricard Solé, Jordi Bascompte, 2012-01-06 Can physics be an appropriate framework for the understanding of ecological science Most ecologists would probably agree that there is little relation between the complexity of natural ecosystems and the simplicity of any example derived from Newtonian physics Though ecologists have long been interested in concepts originally developed by statistical physicists and later applied to explain everything from why stock markets crash to why rivers develop particular branching patterns applying such concepts to ecosystems has remained a challenge Self Organization in Complex Ecosystems is the first book to clearly synthesize what we have learned about the usefulness of tools from statistical physics in ecology Ricard Sol and Jordi Bascompte provide a comprehensive introduction to complex systems theory and ask do universal laws shape the structure of ecosystems at least at some scales They offer the most compelling array of theoretical evidence to date of the potential of nonlinear ecological interactions to generate nonrandom self organized patterns at all levels Tackling classic ecological questions from population dynamics to biodiversity to macroevolution the book's novel presentation of theories and data shows the power of statistical physics and complexity in ecology Self Organization in Complex Ecosystems will be a staple resource for years to come for ecologists interested in complex systems theory as well as mathematicians and physicists interested in ecology

The Spatial and Temporal Dynamics of Host-Parasitoid Interactions Michael Hassell, 2000-06-08 This book examines our current understanding of the population dynamics of one kind of interaction that between insect parasitoids and their hosts Parasitoids are amongst the most abundant of all animals and make up about 10% or more of metazoan species Almost no insect species escape their attack Host parasitoid interactions were first modelled over fifty years ago but for many years there was little good empirical information on the important factors that affect host and parasitoid populations The models were very simple and their predictions rather divorced from the complexity of what was visible in the field Now better data is available on many components of host parasitoid systems from field observations and laboratory and field experiments and this allows a much closer correspondence between models and data In particular the past twenty years have seen major advances in our understanding of how host parasitoid interactions are influenced by spatial processes by age structure effects and by competition from additional host and parasitoid species The result is a body of theory that makes direct contact with real systems in the field and provides us with a detailed understanding of what underpins a whole area of population dynamics In this book Michael P Hassell pulls the theory and field data together to

present an elegant illustration of the way in which ecological studies advance

Mathematical Biology II James D. SHORT BOOK REVIEWS

Statistical Approaches for Hidden Variables in Ecology Nathalie Peyrard, Olivier Gimenez, 2022-03-08 The study of ecological systems is often impeded by components that escape perfect observation such as the trajectories of moving animals or the status of plant seed banks These hidden components can be efficiently handled with statistical modeling by using hidden variables which are often called latent variables Notably the hidden variables framework enables us to model an underlying interaction structure between variables including random effects in regression models and perform data clustering which are useful tools in the analysis of ecological data This book provides an introduction to hidden variables in ecology through recent works on statistical modeling as well as on estimation in models with latent variables All models are illustrated with ecological examples involving different types of latent variables at different scales of organization from individuals to ecosystems Readers have access to the data and R codes to facilitate understanding of the model and to adapt inference tools to their own data

Butterflies Carol L. Boggs, Ward B. Watt, Paul R. Ehrlich, 2019-06-15 In *Butterflies Ecology and Evolution Taking Flight* the world's leading experts synthesize current knowledge of butterflies to show how the study of these fascinating creatures as model systems can lead to deeper understanding of ecological and evolutionary patterns and processes in general The twenty six chapters are organized into broad functional areas covering the uses of butterflies in the study of behavior ecology genetics and evolution systematics and conservation biology Especially in the context of the current biodiversity crisis this book shows how results found with butterflies can help us understand large rapid changes in the world we share with them for example geographic distributions of some butterflies have begun to shift in response to global warming giving early evidence of climate change that scientists politicians and citizens alike should heed The first international synthesis of butterfly biology in two decades *Butterflies Ecology and Evolution Taking Flight* offers students scientists and amateur naturalists a concise overview of the latest developments in the field Furthermore it articulates an exciting new perspective of the whole group of approximately 15 000 species of butterflies as a comprehensive model system for all the sciences concerned with biodiversity and its preservation Contributors Carol L Boggs Paul M Brakefield Adriana D Briscoe Dana L Campbell Elizabeth E Crone Mark Deering Henri Descimon Erika I Deinert Paul R Ehrlich John P Fay Richard French Constant Sherri Fownes Lawrence E Gilbert Andr Gilles Ilkka Hanski Jane K Hill Brian Huntley Niklas Janz Greg Kareofelas Nusha Keyghobadi P Bernhard Koch Claire Kremen David C Lees Jean Francois Martin Antonia Monteiro Paulo Cesar Motta Camille Parmesan William D Patterson Naomi E Pierce Robert A Raguso Charles Lee

Individual-based Modeling and Ecology Volker Grimm,Steven F. Railsback,2013-11-28 Individual based models are an exciting and widely used new tool for ecology These computational models allow scientists to explore the mechanisms through which population and ecosystem ecology arises from how individuals interact with each other and their environment This book provides the first in depth treatment of individual based modeling and its use to develop theoretical understanding of how ecological systems work an approach the authors call individual based ecology Grimm and Railsback start with a general primer on modeling how to design models that are as simple as possible while still allowing specific problems to be solved and how to move efficiently through a cycle of pattern oriented model design implementation and analysis Next they address the problems of theory and conceptual framework for individual based ecology What is theory That is how do we develop reusable models of how system dynamics arise from characteristics of individuals What conceptual framework do we use when the classical differential equation framework no longer applies An extensive review illustrates the ecological problems that have been addressed with individual based models The authors then identify how the mechanics of building and using individual based models differ from those of traditional science and provide guidance on formulating programming and analyzing models This book will be helpful to ecologists interested in modeling and to other scientists interested in agent based modeling
