Long Range Investigations Hrw,1998-01-01      MARGO M. Kucera,R. Schneider,M. Weinelt,2006-04-10 MARGO Multiproxy Approach for the Reconstruction of the Glacial Ocean surface summarizes the results of the MARGO international working group with the aim to develop an updated and harmonised reconstruction of sea surface temperatures and sea ice extent of the Last Glacial Maximum oceans The MARGO approach differs from previous efforts by developing and consistently applying measures of various aspects of reconstruction reliability and by combining faunal and geochemical proxies In 14 papers the volume provides a comprehensive review of earlier work and a series of new proxy specific reconstructions based on census counts of planktonic foraminifera diatoms radiolaria and dinoflagellate cysts as well as on Mg Ca measurements in planktonic foraminifera The approach of harmonising the calibration and application of different proxies is described in detail various paleothermometry techniques and their results are compared and the challenge of treating sparsely sampled data as the basis for ocean circulation models is addressed The use of stable oxygen isotope composition of foraminiferal shells as a proxy for past sea water composition is comprehensively reassessed and a new approach to the transfer function paleothermometer is presented This volume represents a landmark contribution to the understanding of ice age oceanography as well as the proxies used to reconstruct past ocean states The results will form the basis for forcing and validation of ocean circulation models New regional reconstructions of Last Glacial Maximum ocean temperatures and sea ice cover Compilation of new calibration and fossil datasets as well as documentation of techniques and approaches to paleoenvironmental reconstructions Comparison of techniques proxies and modelling approaches

material that ultimately becomes part of the geologic record and the modeling techniques that used to represent these processes The presentations on the geologic record of eolian deposition documented our present understanding of the nature and causes of climate change on time scales of the last glacial ages tens of thousands of years to time scales over which the arrangement of continents mountains and oceans has changed substantially tens of millions of years There has been a growing recognition of the importance of global climatic changes to the future well being of humanity In particular the climatic response to human alterations to the earth's surface and chemical composition has led to concern over the agricultural ecological and societal impacts of such potential global changes
