External Senses A.C. Damask, 2012-12-02 External Senses the second volume in the series Medical Physics focuses on the electrophysiology and biophysics of the receptors as these are common in each species. This book also briefly discusses brain pathways but the topic on synapsing mechanism and brain electrophysiology are covered in the last volume. This volume focuses on the category of senses which respond to external stimuli: taste, smell, touch, hearing, and vision. The results of research presented in this volume, although limited in terms of medical applications because they are not precisely defined, pave the way towards medical treatment in the future. The topics of each chapter focus on broad areas such as gustation, olfaction, cutaneous sensation, audition, vision, and psychophysics. This book is a helpful tool for all undergraduates, premedical students, and postgraduate students of various scientific disciplines.

Walker, 2003-12-01 Since its development in the late 1970s the Moire Fringe method has become a standard technique for the measurement of the behavior of materials and structures Edited by one of the co inventors of the technique the Handbook of Moire Measurement brings together a series of extended case studies from recognized experts in the field The emphasis is on the use of the Moire Fringe method in the measurement of the behavior of materials and structures

Soft Sensors for Monitoring and Control of Industrial Processes Luigi Fortuna, Salvatore Graziani, Alessandro Rizzo, Maria Gabriella Xibilia, 2007-05-31 focussed on the key steps in soft sensor design data selection model structure selection and model validation respectively Extensions to the basic steps of soft sensor design namely soft sensor performance enhancement and the modifications needed to facilitate different industrial process applications follow in Chapter 7 and 8 respectively Widening the applications range and role of soft sensors to fault detection and sensor validation configurations is dealt with in Chapter 9 A great strength of Soft Sensors for Monitoring and Control of Industrial Processes is the use throughout the text of a set of industrial case studies to demonstrate the successes and drawbacks of the different methods used to create soft sensor models A number of different methods may be used in each separate step of the soft sensor design process and the industrial case studies are often used to provide explicit comparisons of the performance of these methods The industrial control and process engineer will find these comparison exercises invaluable illustrations of the sort of results that might be found in industrial applications The monograph also highlights the importance of using knowledge from industrial experts and from the existing industrial process literature This is an important aspect of industrial control that is not very widely acknowledged or taught in control courses Most industrial processes have already generated a significant experimental knowledge base and the control engineer should develop ways of tapping into this valuable resource when designing industrial control schemes

Monitoring and Control of Information-Poor Systems Arthur L. Dexter, 2012-02-16 The monitoring and control of a system whose behaviour is highly uncertain is an important and challenging practical problem Methods of solution based on fuzzy techniques have generated considerable interest but very little of the existing literature considers explicit ways of taking uncertainties into account This book describes an approach to the monitoring and control of information poor systems that is based on fuzzy relational models which generate fuzzy outputs The first part of Monitoring and Control of Information Poor Systems aims to clarify why design decisions must take account of the uncertainty associated with optimal choices and to explain how a fuzzy relational model can be used to generate a fuzzy output which reflects the uncertainties associated with its predictions Part two gives a brief introduction to fuzzy

decision making and shows how it can be used to design a predictive control scheme that is suitable for controlling information poor systems using inaccurate measurements Part three describes different ways in which fuzzy relational models can be generated online and explains the practical issues associated with their identification and application The final part of the book provides examples of the use of the previously described techniques in real applications Key features Describes techniques applicable to a wide range of engineering environmental medical financial and economic applications Uses simple examples to help explain the basic techniques for dealing with uncertainty Describes a novel design approach based on the use of fuzzy relational models Considers practical issues associated with applying the techniques to real systems Monitoring and Control of Information Poor Systems forms an invaluable resource for a wide range of graduate students and is also a comprehensive reference for researchers and practitioners working on problems involving mathematical modelling and control
