Modern Optics:

Modern Optics B. D. Guenther, 2018 *Modern Optics* is a fundamental study of the principles of optics using a rigorous physical approach based on Maxwell's Equations. The treatment provides the mathematical foundations needed to understand a number of applications such as laser optics, fiber optics, and medical imaging covered in an engineering curriculum as well as the traditional topics covered in a physics based course in optics. In addition to treating the fundamentals in optical science, the student is given an exposure to actual optics engineering problems such as paraxial matrix optics, aberrations, with experimental examples, Fourier transform optics, Fresnel, Kirchhoff formulation, Gaussian waves, thin films, photonic crystals, surface plasmons, and fiber optics. Through its many pictures, figures, and diagrams, the text provides a good physical insight into the topics covered. The course content can be modified to reflect the interests of the instructor as well as the student through the selection of optional material provided in appendixes.

Introduction to Modern Optics Grant R. Fowles, 2012-04-25 A complete basic undergraduate course in modern optics for students in physics, technology, and engineering. The first half deals with classical physical optics, the second quantum nature of light. Solutions.

Modern Optics Simplified B. D. Guenther, 2019 This text reduces the complexity of the coverage of optics to allow students with elementary calculus to learn the principles of optics and modern Fourier theory of diffraction and imaging. Each chapter offers simple examples from real engineering problems and includes current topics in imaging such as optical coherence tomography and fiber optics.
