in Drug Design P.M. Dean, R.A. Lewis, 2007-05-08 High throughput screening and combinatorial chemistry are two of the most potent weapons ever to have been used in the discovery of new drugs. At a stroke it seems to be possible to synthesise more molecules in a month than have previously been made in the whole of the distinguished history of organic chemistry. Furthermore all the molecules can be screened in the same short period. However like any weapons of immense power these techniques must be used with care to achieve maximum impact. The costs of implementing and running high throughput screening and combinatorial chemistry are high as large dedicated facilities must be built and staffed. In addition the sheer number of chemical leads generated may overwhelm the lead optimisation teams in a hail of friendly fire. Mother nature has not entirely surrendered as the number of building blocks that could be used to build libraries would require more atoms than there are in the universe. In addition the progress made by the Human Genome Project has uncovered many proteins with different functions but related binding sites creating issues of selectivity. Advances in the new field of pharmacogenomics will produce more of these challenges. There is a real need to make high throughput screening and combinatorial chemistry into smart weapons so that their power is not dissipated. That is the challenge for modellers, computational chemists, cheminformaticians and IT experts. In this book we have broken down this grand challenge into key tasks.

Trends in QSAR and Molecular Modelling 92 C.G. Wermuth, 1993-09-30 This edition of the Proceedings of the 9th European Symposium on Structure Activity Relationships, QSAR and Molecular Modelling held from September 7-11 1992 in Strasbourg, France, deals with various areas of structure activity relationships and their applications in the design of new drugs. The approximately 175 contributions in the book highlight the interdisciplinary approach between QSAR, molecular modelling and databank based research in the design and development process of new drug candidates and demonstrates the efficacy of these techniques by introducing rationalization at a very early stage in the discovery of bioactive compounds. Internationally renowned specialists review methodologies in the field of SAR concepts and computer assisted drug design covering such topics as De novo design, X-ray and NMR based drug design, Parameters and interactions, Molecular modelling, Molecular similarity, 3D QSAR.

Quantitative Structure-Activity Relationships in Drug Design, Predictive Toxicology, and Risk Assessment Roy, Kunal, 2015-02-28 Quantitative structure activity relationships (QSARs) represent predictive models derived from the application of statistical tools correlating biological activity or other properties of chemicals with descriptors representative of molecular structure and/or property. Quantitative Structure Activity Relationships in Drug Design, Predictive Toxicology and Risk Assessment discusses recent advancements in the field of QSARs with special reference to their application in drug development, predictive toxicology and chemical risk analysis. Focusing on emerging research in the field, this book is an ideal reference source for industry professionals, students and academicians in the fields of medicinal chemistry and toxicology.
