Computational Contact Mechanics Alexander Konyukhov, Karl Schweizerhof, 2012-08-14 This book contains a systematical analysis of geometrical situations leading to contact pairs point to surface surface to surface point to curve curve to curve and curve to surface Each contact pair is inherited with a special coordinate system based on its geometrical properties such as a Gaussian surface coordinate system or a Serret Frenet curve coordinate system The formulation in a covariant form

allows in a straightforward fashion to consider various constitutive relations for a certain pair such as anisotropy for both frictional and structural parts Then standard methods well known in computational contact mechanics such as penalty Lagrange multiplier methods combination of both and others are formulated in these coordinate systems Such formulations require then the powerful apparatus of differential geometry of surfaces and curves as well as of convex analysis The final goals of such transformations are then ready for implementation numerical algorithms within the finite element method including any arbitrary discretization techniques such as high order and isogeometric finite elements which are most convenient for the considered geometrical situation The book proposes a consistent study of geometry and kinematics variational formulations constitutive relations for surfaces and discretization techniques for all considered geometrical pairs and contains the associated numerical analysis as well as some new analytical results in contact mechanics

Contact Mechanics of Articular Cartilage Layers Ivan Argatov, Gennady Mishuris, 2015-06-15 This book presents a comprehensive and unifying approach to articular contact mechanics with an emphasis on frictionless contact interaction of thin cartilage layers The first part of the book Chapters 1 4 reviews the results of asymptotic analysis of the deformational behavior of thin elastic and viscoelastic layers A comprehensive review of the literature is combined with the authors original contributions The compressible and incompressible cases are treated separately with a focus on exact solutions for asymptotic models of frictionless contact for thin transversely isotropic layers bonded to rigid substrates shaped like elliptic paraboloids The second part Chapters 5 6 and 7 deals with the non axisymmetric contact of thin transversely isotropic biphasic layers and presents the asymptotic modelling methodology for tibio femoral contact The third part of the book consists of Chapter 8 which covers contact problems for thin bonded inhomogeneous transversely isotropic elastic layers and Chapter 9 which addresses various perturbational aspects in contact problems and introduces the sensitivity of articular contact mechanics This book is intended for advanced undergraduate and graduate students researchers in the area of biomechanics and engineers interested and involved in the analysis and design of thin layer structures

Geometrically Exact Theory for Contact Interactions Alexander Konyukhov, 2014-08-22 The intuitive understanding of contact bodies is based on the geometry and adjoining surfaces A powerful approach to solve the contact problem is to take advantage of the geometry of an analyzed object and describe the problem in the best coordinate system This book is a systematical analysis of geometrical situations leading to contact pairs surface to surface curve to surface point to surface as a result resulting in the corresponding computational algorithms to solve the contact problem
