Numerical Models of Oceans and Oceanic Processes Lakshmi H. Kantha,Carol Anne Clayson,2000-08-04

Oceans play a pivotal role in our weather and climate Ocean borne commerce is vital to our increasingly close knit global community Yet we do not fully understand the intricate details of how they function how they interact with the atmosphere and what the limits are to their biological productivity and their tolerance to wastes While satellites are helping us to fill in the gaps numerical ocean models are playing an important role in increasing our ability to comprehend oceanic processes monitor the current state of the oceans and to a limited extent even predict their future state Numerical Models of Oceans and Oceanic Processes is a survey of the current state of knowledge in this field It brings together a discussion of salient oceanic dynamics and processes numerical solution methods and ocean models to provide a comprehensive treatment of the topic Starting with elementary concepts in ocean dynamics it deals with equatorial mid latitude high latitude and coastal dynamics from the perspective of a modeler A comprehensive and up to date chapter on tides is also included This is followed by a discussion of different kinds of numerical ocean models and the pre and post processing requirements and techniques Air sea and ice ocean coupled models are described as well as data assimilation and nowcast forecasts Comprehensive appendices on wavelet transforms and empirical orthogonal functions are also included This comprehensive and up to date survey of the field should be of interest to oceanographers atmospheric scientists and climatologists While some prior knowledge of oceans and numerical modeling is helpful the book includes an overview of enough elementary material so that along with its companion volume Small Scale Processes in Geophysical Flows it should be useful to both students new to the field and practicing professionals Comprehensive and up to date review Useful for a two semester or one semester on selected topics graduate level course Valuable reference on the topic Essential for a better understanding of weather and climate

Inverse Modeling of the Ocean and Atmosphere Andrew F. Bennett,2005-10-20

together with elaborate observing systems are examined in detail The book offers a review of the various alternative approaches and further advanced research topics are discussed Derived from the author s lecture notes this book constitutes an ideal course companion for graduate students as well as being a valuable reference source for researchers and managers in theoretical earth science civil engineering and applied mathematics

Data Assimilation in Ocean Models Rebecca Woodgate,1994 *Data Assimilation in Ocean Models* A. M. Moore,1986 Methods for Data Assimilation in Oceanography J. Nycander,1999 Advances in Ocean Data Assimilation: Methodologies, Forecasting and Reanalysis Shiqiu Peng,Yasumasa Miyazawa,Youmin Tang,Jinyu Sheng,Zhijin Li,2023-12-01 Advanced Physical Oceanographic Numerical Modelling James J. O'Brien,2013-03-09 This book is a direct result of the NATO Advanced Study Institute held in Banyuls sur mer France June 1985 The Institute had the same title as this book It was held at Laboratoire Arago Eighty lecturers and students from almost all NATO countries attended The purpose was to review the state of the art of physical oceanographic numerical modelling including the parameterization of physical processes This book represents a cross section of the lectures presented at the ASI It covers elementary mathematical aspects through large scale practical aspects of ocean circulation calculations It does not encompass every facet of the science of oceanographic modelling We have however captured most of the essence of mesoscale and large scale ocean modelling for blue water and shallow seas There have been considerable advances in modelling coastal circulation which are not included The methods section does not include important material on phase and group velocity errors selection of grid structures advanced methods to conservation in highly nonlinear systems inverse methods and other important ideas for modern ocean modelling Hopefully this book will provide a foundation of knowledge to support the growth of this emergent field of science The NATO Advanced Study Institute was supported by many organizations The seed money of course was received from the NATO Science Committee Many national organizations provided travel money for participants In France CNES IFREMER and CNRS provided funds to support the French participants In the U S Coastal Ocean Modeling Using Variational Methods for Freshwater Dispersal Study, Data Assimilation and Observing System Design Weifeng Zhang,2009 Coastal oceans as highly productive components of the global ocean play crucial roles in global carbon cycle and climate change The wide continental shelf off US east coast is a typical coastal environment that serves as a buffer zone between human activities and open oceans This thesis investigates the dispersal pattern of Hudson River outflow in the New York Bight NYB It applies adjoint sensitivity Incremental Strong Constraint 4D Variational Data Assimilation IS4DVAR and representer based optimal observation to integrate coastal ocean modeling and observation capabilities Firstly analysis of a 2 year model simulation identifies three freshwater pathways along i the New Jersey coast ii the Long Island coast and iii a Mid shelf Pathway It is shown that the New Jersey coast Pathway dominates winter months and the Mid shelf Pathway summer months It is also demonstrated that wind is the primary force for spreading freshwater into mid and outer shelf and presence of the Hudson Valley strengthens freshwater

recirculation in the New York Apex area Secondly the Constituent oriented Age and Residence time Theory is implemented to simulate the age and residence time of the Hudson River plume Analysis shows strong seasonality of surface mean age and residence time consistent with seasonal variation of the circulation Time series analysis shows that spatial and temporal variations of the time scales in NYB are largely buoyancy and wind driven Thirdly adjoint sensitivity analysis applied on the New Jersey inner shelf identifies water sources and quantitatively compares the contributions of different variables to a chosen oceanic process Fourthly IS4DVAR is used to assimilate observational data collected by all instrument types during spring 2006 It reduces the model observation misfit by 60% and improves forecast of temperature salinity and velocity Finally a representer based optimal observation system is applied to identify the optimal sampling locations for predicting salt transport within the Hudson Shelf Valley The system is then used to compare the influence area of existing observations This work prototypes the integration of observation and modeling in a coastal environment and demonstrates the use of traditional and variational tools to reveal the physical processes in a shelf region

Modelling Ocean Climate Variability

Artem S. Sarkisyan, Jürgen Sündermann, 2009-05-13 In this wide ranging and comprehensive review of the historical development and current status of ocean circulation models the analysis extends from simple analytical approaches to the latest high resolution numerical models with data assimilation The authors both of whom are pioneer scientists in ocean and shelf sea modelling look back at the evolution of Western and Eastern modelling methodologies during the second half of the last century They also present the very latest information on ocean climate modelling and offer examples for a number of oceans and shelf seas The book includes a critical analysis of literature on ocean climate variability modelling as well as assessing the strengths and weaknesses of the best known modelling techniques It also anticipates future developments in the field focusing on models based on a synthesis of numerical simulation and field observation and on nonlinear thermodynamic model data synthesis
