*Phenolic Compounds in Food* Leo M.L. Nollet, Janet Alejandra Gutierrez-Uribe, 2018-01-29 Phenolic compounds one of the most widely distributed groups of secondary metabolites in plants have received a lot of attention in the last few years since the consumption of vegetables and beverages with a high level of such compounds may reduce risks of the development of several diseases This is partially due to their antioxidant power since other interactions with cell functions have been discovered What's more phenolic compounds are involved in many functions in plants such as sensorial properties structure pollination resistance to pests and predators germination processes of seed development and reproduction Phenolic compounds can be classified in different ways ranging

from simple molecules to highly polymerized compounds Phenolic Compounds in Food Characterization and Analysis deals with all aspects of phenolic compounds in food In five sections the 21 chapters of this book address the classification and occurrence of phenolic compounds in nature and foodstuffs discuss all major aspects of analysis of phenolic compounds in foods such as extraction clean up separation and detection detail specific analysis methods of a number of classes of phenolic compounds from simple molecules to complex compounds describe the antioxidant power of phenolic compounds and discuss specific analysis methods in different foodstuffs

#### **Natural Products of Woody Plants**

John W. Rowe, 2012-12-06 Wood as found in trees and bushes was of primary importance to ancient humans in their struggle to control their environment Subsequent evolution through the Bronze and Iron Ages up to our present technologically advanced society has hardly diminished the importance of wood Today its role as a source of paper products furniture building materials and fuel is still of major significance Wood consists of a mixture of polymers often referred to as lignocellulose The cellulose micro fibrils consist of an immensely strong linear polymer of glucose They are associated with smaller more complex polymers composed of various sugars called hemicelluloses These polysaccharides are embedded in an amorphous phenylpropane polymer lignin creating a remarkably strong composite structure the lignocellulosic cell wall Wood also contains materials that are largely extraneous to this lignocellulosic cell wall These extracellular substances can range from less than 10% to about 35% of the dry weight of the wood but the usual range is 2% 10% Among these components are the mineral constituents salts of calcium potassium sodium and other metals particularly those present in the soil where the tree is growing Some of the extraneous components of wood are too insoluble to be extracted by inert solvents and remain to give extractive free wood its color very often these are high molecular weight polyphenolics
