Exposure and body burden of environmental pollution and risk of cancer in a historically contaminated areas Ingela Helmfrid, 2019-10-17 There are many villages where environmental contamination is substantial due to historical industrial activities According to the European Environment Agency there are about 2 5 million potentially contaminated sites in the European member states In Sweden there are about 80 000 more or less contaminated areas About 1000 of them are classified into the highest risk category Hazard Class 1 and should be remediated Population exposure due to these industrially contaminated sites may contribute to adverse health effects and is a global environmental problem The general aim of this thesis was to evaluate the occurrence of cancer in populations residing in contaminated areas in relation to indirect exposure via the long term consumption of locally produced food taking into account residential occupational and lifestyle factors Associations between reported local food consumption frequencies biomarker concentrations and environmental and lifestyle factors were explored The Swedish national cancer registers and questionnaire information was used to identify cancer risk groups in the study population The questionnaire was evaluated regarding how well it reflected measured levels of biomarkers in human biological samples and how the consumption of local food from contaminated areas contributed to the total body burden of contaminants Despite historically high environmental levels of contaminants in the soil and sediments current contaminant exposure in the studied population living in the contaminated areas was similar to or only moderately higher than that of the general population No significant associations with increased cancer risk were detected in the highest tertile of metals concentrations in blood or PAH in urine Reported long term high consumption of certain local foods was associated with higher cadmium vegetarian

food and lead fish meat concentrations in blood and urine Long term high consumption of non local food from places outside the study areas was not associated with increased concentrations of metals compared with consumers of local food It was concluded that the questionnaire information on consumption of locally produced food describes differences in food consumption in the study population reasonably well An increased risk of cancer was associated with smoking family history of cancer and obesity Residing in a contaminated area during the first five years of life was associated with an increased risk of cancer which may indicate exposure to contaminants in early life Also long term high consumption of particular local foods fish chicken lamb game meat was associated with an increased risk of various forms of cancer while reported high consumption of these foods from non local sources was not associated with increased risk of cancer The associations between habitual consumption of local food and different types of cancer may reflect a higher exposure in the past and thus if consumption of local food contributes to the risk of acquiring cancer that contribution is probably lower today than previously Furthermore it cannot be ruled out that other contaminants in the food contribute to the increased cancer risks observed In conclusion the questionnaire that was developed for the present thesis can identify risk groups within populations and can be used as a tool in a health risk assessment

Soil Contamination Simone Pascucci,2011-09-12 Soil contamination has severely increased over the last decades mainly due to petroleum hydrocarbons solvents pesticides lead and other heavy metals from industrial wastes and human activities The critical point regarding contaminated soil monitoring is the intrinsic difficulty in defining fixed monitoring variables and indicators as the establishment of any a priori criterion and threshold for soil quality can be still considered subjective This book is organized into eight chapters and presents the state of the art and new research highlights in the context of contaminated soil monitoring and remediation strategies including examples from South America Europe and Asia The chapters deal with the following topics monitoring of dioxin furan hydrocarbons and heavy metals level in soils bioindicators and biomarkers for the assessment of soil toxicity use of reflectance spectroscopy for soil contaminants and waste material detection remediation technologies and strategies

EESD 2013 November 12 12 2013 Shanghai China Evaluation of Environmental Contaminants and Natural Products: A Human Health Perspective Ashita Sharma, Manish Kumar, Satwinderjeet Kaur, Avinash Kaur Nagpal, 2019-06-10 Unbridled urbanization and development of natural land resources has led to the degradation of our surrounding environment. The air that we breathe, the water we drink, and the food we eat is at risk of being contaminated with a plethora of chemical pollutants, some of them being potentially carcinogenic. This presents a challenge to human health. This book attempts to address this challenge in two parts which represent two different approaches. The first part of the book summarizes the alarming effects of environmental contaminants. Various studies depicting the direct relationship of environmental contaminants with cancer incidence have been referenced. Scientific studies have established an inverse relation between cancer and ingestion of dietary phytoconstituents (phytochemicals) in the form of fruits, vegetables, and botanical herbs. Plant products as dietary supplements can suppress contaminant toxicity by regulating the resulting reactive species and also by assisting their bodily excretion through Phase 1 and Phase 2 enzyme metabolism. The second part of the book shifts focus to phytoconstituents which, if included in diet, can prevent the harmful effects of pollutants. The text references numerous studies showing the anti-mutagenic, anti-genotoxic, and anti-carcinogenic potential of many plant products. The combination of information about contemporary issues of carcinogenic contaminants in the environment, coupled with the references to relevant studies in this handbook, will enlighten readers studying courses in environmental chemistry, toxicology, botany, and ecology about environmental toxins and help them understand specific dietary measures known to reduce the toxic impact. Researchers in the field of nutrition can also benefit from the information provided.
