

antérieurs petite. Cuisses et tibias des trois paires hérissés de poils bruns assez courts à leur face interne, sans poils dressés en dehors.

Fig. 52 et 53. — *Bostrychus capucinus* L. Profil de l'avant-corps (fig. 52) et variation du bord antérieur du prothorax (fig. 53 a-d).

2^e article des tarses antérieurs plus court que le dernier. Vestiture sous-tarsienne fort courte, brune. Ailes fortement enfumées.

Chez le ♂ les tarses postérieurs sont munis en dessous de longues soies brunes qui font défaut chez la ♀.

La suture fronto-clypéale n'est pas toujours nettement marquée dans toute la largeur de la tête; parfois même elle n'est indiquée que par une vague dépression transverse médiane. L'épistome porte quelquefois, mais rarement, une carinule médiane longitudinale. Cette constatation peut avoir quelque intérêt, comme fournissant un nouvel indice de la parenté des *Bostrychus* et *Dexicrates*. Le contour du bord antérieur du prothorax entre les angles antérieurs varie beaucoup : le plus souvent il est sinué en accolade ou très obtusément échancré; d'autres fois il est presque rectilignement tronqué, ou bien il présente au milieu une entaille profonde et assez étroite (fig. 53 d). La ponctuation des élytres est plus ou moins dense. Le 2^e article des tarses postérieurs est généralement un peu plus long que le dernier.

La variété *nigriventris* Luc. a l'abdomen entièrement noir, à part le bord postérieur des segments médians; la ponctuation des élytres est plus dense et un peu plus forte que chez le type. Chez le *luctuosus* Ol., le corps tout entier est noir et la ponctuation est aussi plus dense qu'elle ne l'est généralement chez le type. Enfin, dans le *rubricentris* Zouf., les élytres sont noirs comme la tête, le prothorax, la poitrine et le premier segment abdominal; mais le reste de l'abdomen est rouge comme chez le type.

Ces variétés ne sont pas tranchées. On trouve des individus à élytres rouges et à abdomen brun rougeâtre établissant une transition
