Wright, Michael G. Morrow, 2011-12-22 From the Foreword There are many good textbooks today to teach digital signal processing but most of them are content to teach the theory and perhaps some MATLAB simulations This book has taken a bold step forward It not only presents the theory it reinforces it with simulations and then it shows us how to actually use the results in real time applications This last step is not a trivial step and that is why so many books and courses present only theory and simulations With the combined expertise of the three authors of this text the reader can step into the real time world of applications with a text that presents an accessible path Delores M Etter Texas Instruments Distinguished Chair in Electrical Engineering and Executive Director Caruth Institute for Engineering Education Southern Methodist University Dallas Texas USA Mastering practical application of real time digital signal processing DSP remains one of the most challenging and time consuming pursuits in the field It is even more difficult without a resource to bridge the gap between theory and practice Filling that void Real Time Digital Signal Processing from MATLAB to C with the TMS320C6x DSPs Second Edition is organized in three sections that cover enduring fundamentals and present practical projects and invaluable appendices This updated edition gives readers hands on experience in real time DSP using a practical step by step framework that also incorporates demonstrations exercises and problems coupled with brief overviews of applicable theory and MATLAB application Engineers educators and students rely on this book for precise simplified instruction on use of real time DSP applications The book's software supports the latest high performance hardware including the powerful inexpensive and versatile OMAP L138 Experimenter Kit and other development boards Incorporating readers valuable feedback and suggestions this installment covers additional topics such as PN sequences and more advanced real time DSP projects including higher order digital communications projects making it even more valuable as a learning tool **Building**

Wright,2013-04-18 The death of Professor Arthur Wright in the summer of 1996 deprived me of a friend and a colleague whose judgement and experience shaped this book I pay tribute to his contributions to protection and electrical engineering education In the five years since the first edition appeared many developments have taken place and it is now necessary to update the book The use of digital communications and advanced signal processing techniques is now widespread and several fully numeric relays are available from manu facturers Two new Chapters 13 and 14 have been added to introduce readers to these concepts and associated techniques Artificial intelligence is making its impact in all engineering applications and power system protection is no exception Expert systems fuzzy logic artificial neural networks adaptive and integrated protection synchronized measurements using the global positioning system genetic algorithms flexible a c transmission systems are some of the techniques considered in connection with protection Although many of these techniques have not yet found major application in protection it is nevertheless essential for the educated protection engineer to have a basic understanding of the underlying principles and methodology so that he or she can evaluate their suitability for new relaying problems and applications Chapter 15 was therefore added to guide readers through this developing area I have also added some new material in other chapters to reflect changes over the past years Digital Design of Signal Processing Systems
