Marks, Gerd Plewig, 2012-12-06 In the last fifty years dramatic progress has been made in the understanding of skin and skin diseases. Although we are still somewhat off understanding the ultimate causes of such disorders as psoriasis, atopic dermatitis and the congenital disorder of keratinization, we now have considerable information on the physiological disturbances in various diseases. This has permitted and encouraged a rational approach to treatment. The successful use of antimetabolic agents, immunomodulators and retinoids may be cited as examples. A major reason for this improvement may be the fact that researchers accept models for the investigation of skin diseases. Increasing numbers of them have become available in the past years. So many have been described that it is doubtful whether any researcher is aware of all the other models described even in his own field of interest. This book is a challenge for those involved in the study of skin and its disorders to use the sundry models of skin that have proven helpful. It would be impossible for this work to be all embracing, but it is hoped that the choice of models offered in this publication will be stimulating and helpful in the solution of knotty skin questions. Proof of the efficacy of dermatological products is a prerequisite for clinical testing and registration. Now efficacy claims for cosmetics must be equally substantiated. This book provides a concise practical but comprehensive overview of experimental models used to screen, develop and select dermatological and cosmetic formulations. The authors are recognized specialists in their field and use a standardized approach to the projects, facilitating the reading for the stressed scientist, for the R & D managers' general view as well as for the beginners in the field. Skin Pharmacology and Toxicology, Corrado L. Galli, Christopher N. Hensby, Marina Marinovich, 2012-12-06. Major skin diseases including acne, psoriasis and eczema affect the majority of the population at some time in their lives. In general, these diseases are physically and psychologically disfiguring for the sufferers; furthermore, by their very chronic nature, skin diseases unlike most other disease processes present both acute and chronic therapy problems. In addition, the chronic nature of these diseases can present certain economic problems. Firstly, chronic therapy is becoming increasingly expensive, and secondly, patients adhering to a strict treatment regimen will frequently be absent from their gainful employment for either medical consultation or treatment. Given that in all NATO countries the average age of the population is continually increasing, these chronic skin diseases will increase in importance in the coming years. Furthermore, as the average population age increases, additional disease processes such as skin photodamage and carcinogenicity risk become major areas of therapeutic concern. This book reviews in detail the major scientific areas of interest for research and clinical scientists working in skin pharmacology and toxicology. The basic principles relating to an understanding of how drugs and chemicals may influence either the skin or the body as a whole are
