Large Eddy Simulation for Incompressible Flows P. Sagaut, 2013-04-18 The astonishingly rapid development of the Large Eddy Simulation technique during the last two or three years both from the theoretical and applied points of view have rendered the first edition of this book lacunary in some ways Three to four years ago when I was working on the manuscript of the first edition coupling between LES and multiresolution multilevel techniques was just an emerging idea Nowadays several applications of this approach have been successfully developed and applied to several flow configurations Another example of interest from this exponentially growing field is the development of hybrid RANS LES approaches which have been derived under many different forms Because these topics are promising and seem to be possible ways of enhancing the applicability of LES I felt that they should be incorporated in a general presentation of LES Recent developments in LES theory also deal with older topics which have been intensely revisited by researchers a unified theory for deconvolution and scale similarity ways of modeling have now been established the no model approach popularized as the MILES approach is now based on a deeper theoretical analysis a lot of attention has been paid to the problem of the definition of boundary conditions for LES filtering has been extended to Navier Stokes equations in general coordinates and to Eulerian time domain filtering

Higher-Order Compact Schemes for Numerical Simulation of Incompressible Flows National Aeronautics and Space Administration (NASA), 2018-07-05 A higher order accurate numerical procedure has been developed for solving incompressible Navier Stokes equations for 2D or 3D fluid flow problems It is based on low storage Runge Kutta schemes for temporal discretization and fourth and sixth order compact finite difference schemes for spatial discretization The particular difficulty of satisfying the divergence free velocity field required in incompressible fluid flow is resolved by

solving a Poisson equation for pressure It is demonstrated that for consistent global accuracy it is necessary to employ the same order of accuracy in the discretization of the Poisson equation Special care is also required to achieve the formal temporal accuracy of the Runge Kutta schemes The accuracy of the present procedure is demonstrated by application to several pertinent benchmark problems Wilson Robert V and Demuren Ayodeji O and Carpenter Mark Langley Research Center NAS1 19480 RTOP 505 90 52 01 *Numerical Simulation of 3-D Incompressible Unsteady Viscous Laminar Flows* Michel Deville, Thien-Hiep Lê, Yves Morchoisne, 2013-03-09 The GAMM Committee for Numerical Methods in Fluid Mechanics GAMM Fachausschuss für Numerische Methoden in der Strömungsmechanik has sponsored the organization of a GAMM Workshop dedicated to the numerical simulation of three dimensional incompressible unsteady viscous laminar flows to test Navier Stokes solvers The Workshop was held in Paris from June 12th to June 14th 1991 at the Ecole Nationale Supérieure des Arts et Métiers Two test problems were set up The first one is the flow in a driven lid parallelepipedic cavity at $Re = 3200$ The second problem is a flow around a prolate spheroid at incidence These problems are challenging as fully transient solutions are expected to show up The difficulties for meaningful calculations come from both space and temporal discretizations which have to be sufficiently accurate to resolve detailed structures like Taylor Görtler like vortices and the appropriate time development Several research teams from academia and industry tackled the tests using different formulations velocity pressure vorticity velocity different numerical methods finite differences finite volumes finite elements various solution algorithms splitting coupled various solvers direct iterative semi iterative with preconditioners or other numerical speed up procedures The results show some scatter and achieve different levels of efficiency The Workshop was attended by about 25 scientists and drove much interaction between the participants The contributions in these proceedings are presented in alphabetical order according to the first author first for the cavity problem and then for the prolate spheroid problem No definite conclusions about benchmark solutions can be drawn *The DROPS Package for Numerical Simulations of Incompressible Flows Using Parallel Adaptive Multigrid Techniques*, 2002 Higher-Order Compact Schemes for Numerical Simulation of Incompressible Flows Robert V. Numerical Simulation of Turbulent Incompressible Flows Andrés G. Vidal, 2015 A meshless direct pressure velocity coupling procedure is presented to perform Direct Numerical Simulations DNS and Large Eddy Simulations LES of turbulent incompressible flows in regular and irregular geometries The proposed method is a combination of several efficient techniques found in different Computational Fluid Dynamic CFD procedures and it is a major improvement of the algorithm published in 2007 by this author This new procedure has very low numerical diffusion and some preliminary calculations with 2D steady state flows show that viscous effects become negligible faster than ever predicted numerically The fundamental idea of this proposal lays on several important inconsistencies found in three of the most popular techniques used in CFD segregated procedures streamline vorticity formulation for 2D viscous flows and the fractional step method very popular in DNS LES The inconsistencies found become important in elliptic flows and they might lead to some wrong solutions if coarse grids are used In all methods studied the mathematical basement was found to be correct in most cases but inconsistencies were found when writing the boundary conditions In all methods analyzed it was found that it is basically impossible to satisfy the exact set of boundary conditions and all formulations use a reduced set valid for parabolic flows only For example for segregated methods boundary condition of normal derivative for pressure zero is valid only in parabolic flows Additionally the complete proposal for mass balance correction is right exclusively for parabolic flows
