LeRoy Smith, 2021-09-01 When Consumers Power's plan to build a nuclear power plant in Midland Michigan was announced in 1967 it promised to free Michigan residents from expensive dirty coal fired electricity and to keep Dow Chemical operating in the state But before the plan could be completed the facility was called an engineering nightmare a financial disaster a construction boondoggle a political headache and a regulatory muddle Most locals had welcomed nuclear power eagerly Why after almost twenty years and billions of dollars did this promise of a high tech coal free prosperous future fail And what lessons does its failure offer today as Americans try to develop a clean energy economy based on renewable power To answer these questions energy consultant and author LeRoy Smith carefully traces the design and construction decisions made by Consumers Power including its choice of reactor and its hiring of the Bechtel Corporation to manage the project He also details the rapidly changing regulatory requirements and growing public concern about the environmental risks of nuclear power generation An examination of both the challenges and importance of renewable energy this book will be of value to anyone interested in grappling with the complexities of our ongoing efforts to eliminate fossil fuels in favor of clean renewable energy

**Nuclear Power or a Promise Lost** Edward T. Burns, 2020-05-01 This book captures the status of current electrical energy markets including the principal forces affecting decisions on selecting an energy source It represents a seminal work that lays out the electrical energy decision tree for selecting an energy source in a world that is on the verge of catastrophic global warming because of the choices that have been made in the name of cheap energy The impetus for this book includes the dire need to mitigate continued anthropogenic causes of global warming by turning to carbon free energy sources Nuclear energy represents such a carbon free energy source and could be a partial solution to the existential threat facing future society the threat of a warming planet and its consequential catastrophic effects on future generations The world is at a crossroads in human interaction with their environment The effects of radiation and the relationship of nuclear power to nuclear weapons are both discussed in an understandable and compelling manner Nuclear energy is contrasted with other energy sources including fossil fuels and renewable energy sources regarding the risks and benefits imposed by each Important personalities and world events that shaped nuclear power's development are recounted The historical origins of nuclear power are outlined and the continued impetus to include nuclear power as part of the electric grid energy mix is assessed exposing the obstacles and road blocks to the continued use of nuclear power Specific attention is paid to revealing the causes and lessons learned from the three severe accidents in commercial nuclear plants TMI 2 Chernobyl and Fukushima An extensive discussion of nuclear waste disposal is provided as part of the decision tree for energy selection The context for the future of nuclear power as a viable energy source is illuminated by the current battle

between economic growth and the harm created by burning fossil fuels The status of the world's climate and projections for the disruptive effects of global warming on future populations migration economics and world strife are debated against the backdrop of an increasing world population and the drive by developing nations to achieve economic parity with the industrialized nations Within the context of increased world strife the quest by nations to obtain nuclear weapons is also discussed The steps taken by the world to limit nuclear weapons proliferation are examined with emphasis on potential links between nuclear power generation and access to nuclear weapons The final chapter discusses the moral responsibility of current generations with respect to future generations specifically the applicability of intergenerational equity in political and social decision making regarding the actions that add to global warming and those risk averse actions that can be taken to minimize global warming

Beyond Engineering Robert Pool, 1997-07-17 We have long recognized technology as a driving force behind much historical and cultural change. The invention of the printing press initiated the Reformation. The development of the compass ushered in the Age of Exploration and the discovery of the New World. The cotton gin created the conditions that led to the Civil War. Now in *Beyond Engineering* science writer Robert Pool turns the question around to examine how society shapes technology. Drawing on such disparate fields as history, economics, risk analysis, management science, sociology, and psychology, Pool illuminates the complex, often fascinating interplay between machines and society in a book that will revolutionize how we think about technology. We tend to think that reason guides technological development; that engineering expertise alone determines the final form an invention takes. But if you look closely enough at the history of any invention, says Pool, you will find that factors unrelated to engineering seem to have an almost equal impact. In his wide-ranging volume, he traces developments in nuclear energy, automobiles, light bulbs, commercial electricity, and personal computers to reveal that the ultimate shape of a technology often has as much to do with outside and unforeseen forces. For instance, Pool explores the reasons why steam-powered cars lost out to internal combustion engines. He shows that the Stanley Steamer was in many ways superior to the Model T: it set a land speed record in 1906 of more than 127 miles per hour; it had no transmission and no transmission headaches; and it was simpler. One Stanley engine had only twenty-two moving parts and was quieter than a gas engine, but the steamers were killed off by factors that had little or nothing to do with their engineering merits, including the Stanley twins' lack of business acumen and an outbreak of hoof and mouth disease. Pool illuminates other aspects of technology as well. He traces how seemingly minor decisions made early along the path of development can have profound consequences further down the road, and perhaps most important, he argues that with the increasing complexity of our technological advances, from nuclear reactors to genetic engineering, the number of things that can go wrong multiplies, making it increasingly difficult to engineer risk out of the equation. Citing such catastrophes as Bhopal, Three Mile Island, the Exxon Valdez, the Challenger, and Chernobyl, he argues that it is time to rethink our approach to technology. The days are gone when machines were solely a product of larger-than-life inventors and hard-working engineers. Increasingly, technology will be a joint effort, with its design shaped not only by engineers and executives but also by psychologists, political scientists, management theorists, risk specialists, regulators, and courts, and the general public. Whether discussing bovine growth hormone, molten salt reactors, or baboon-to-human transplants, *Beyond Engineering* is an engaging look at modern technology and an illuminating account of how technology and the modern world shape each other.     Challenges and Issues with the Further Aging of U.S. Air Force Aircraft J. R. Gebman, 2009 Over the next 20 years, the further aging of already old aircraft

will introduce challenges and issues for aircraft operators The technical challenges relate to structures propulsion and systems The institutional challenges include limitations on independent verification of fleet status and future condition and on information needed for engineering analyses including risk assessment and an overall scarcity of resources
