

POSITIVE LINEAR OPERATORS IN SEMI-ORDERED LINEAR SPACES

By

Tsuyoshi ANDÔ

Since in 1907 O. PERRON [9] discovered a remarkable spectral property of positive matrices and shortly later G. FROBENIUS [1], [2] and R. JENTZSCH [4] investigated and generalized it further, many authors have considered special properties of positive linear operators. Especially M. KREIN and M. A. RUTMAN [5]^{*} considered with success a generalization to Banach spaces with a cone. They obtained particularly important results, when the space is lattice ordered or the cone has an interior point. In this paper, we consider spectral properties of positive compact (=completely continuous) linear operators on a universally continuous Banach space (= conditionally complete Banach lattice). Our main aim is to generalize the results of G. FROBENIUS [2] to infinite dimensional spaces.

In §1 preliminary definitions are summarized. In §2 the fundamental theorem on the maximum positive spectrum is proved (Theorem 2.1). In §3 we define *completely positive* linear operators. The operators of this class play a similar rôle as strongly positive operators in [5]. In §4 we obtain under some additional conditions a necessary and sufficient condition for that a positive compact linear operator is quasinilpotent (Theorem 4.7). In §5 the proper values with maximum modulus of a positive compact linear operator are determined (Theorem 5.2).

§ 1. Preliminaries. We recall briefly definitions from the theory of semi-ordered linear spaces and linear operators. A lattice ordered linear space (with real scalar) R is said to be *universally continuous*, if for any $\alpha_\lambda \geq 0$ ($\lambda \in A$) there exists $\bigcap_{\lambda \in A} \alpha_\lambda$. A linear manifold N of R is said to be *normal* if there exists a positive linear projection $[N]$ of R onto N such that $|x - [N]x| \wedge |y| = 0$ for $x \in R$ and $y \in N$. The projection
