Willott,

PhD, 1999-07-25 Neurogerontology tells the story of how the aging brain affects all aspects of cognition and physical performance It comprehensively links the principles and substance of neuroscience with gerontology and psychology Written largely from a behavioral neuroscience perspective Neurogerontology explores the functional relationships between the central nervous system and psychological phenomena of aging including perception arousal learning cognition and motor behavior Willott emphasizes healthy aging but dementia and other pathological conditions are discussed when relevant This

evidence based approach to the neuroscience of aging makes this a valuable reference for professionals as well as an informative textbook for students in gerontology courses

Brain Circuitry and Signaling in Psychiatry Gary B. Kaplan, Ronald P. Hammer, 2008-08-13

The 1990s appropriately termed the decade of the brain witnessed unprecedented advances in our knowledge of psychiatric neuroscience Yet with every advance we realized afresh that we were still in the beginning stages of a much longer journey This text chronicles the next step of that journey Structured around a proven teaching methodology that uniquely integrates the clinical aspects of psychiatric disorders with their neurobiology this volume begins with two introductory chapters on functional neural circuitry and neural signaling pathways The remaining six chapters present current knowledge on the neuroanatomic and neurochemical mechanisms underlying schizophrenia addiction anxiety depression bipolar disorder and dementia Alzheimer s disease For clarity and consistency each chapter features the same four divisions clinical presentation neural circuitry signaling pathways and psychopharmacology as they relate to Schizophrenia which reviews studies of the neural basis of schizophrenia and describes how the cortex the thalamus the basal ganglia and the medial temporal lobe work together during normal brain function and then how each is perturbed in psychosis Addiction which focuses on the consequences of psychoactive substance use including compulsive practices e g eating sex Internet browsing that might also involve the same brain circuits and signaling pathways Of exceptional value are two unique illustrations that capture for the first time much of what we know about the anatomy and neurochemistry underlying the behavioral symptoms of addiction Anxiety which presents current hypotheses regarding neurocircuitry and signaling pathways for the three best studied from a neurobiologic perspective anxiety disorders panic disorder posttraumatic stress disorder and obsessive compulsive disorder Depression which offers evidence for the involvement of highly interconnected cortical and limbic structures such as the prefrontal cortex medial thalamus amygdala ventral striatum hippocampus and the hypothalamic pituitary adrenal axis in unipolar major depression and suggests target areas such as the cAMP pathway for study in the development of new antidepressants Bipolar disorder which shows that specific abnormalities in signal transduction pathways including protein kinase activity G protein levels and gene expression are unique to bipolar patients concluding that the actions of lithium and anticonvulsants on intracellular signaling pathways provide a new paradigm for novel pharmacological interventions Dementia and Alzheimer s disease which details current findings on neurofibrillary degeneration relevant genes and proteins pathogenesis metabolic decline defective cell repair and A toxicity and treatment strategies neurotransmitter replacement and neuroprotective and regenerative approaches Discusses frontotemporal dementia dementia with Lewy bodies Parkinson s disease and vascular dementia Meticulously researched and clearly written by 15 contributors all recognized experts from leading research and teaching institutions in the United States this compact and extensively illustrated volume stands out in the literature because it combines readability and practicality with the breadth and depth typically found only in far lengthier works Psychiatric practitioners residents and students alike

will welcome this informative easy to read text which will also be of special interest to mental health and pharmaceutical industry professionals and of general interest to anyone who wants to know more about the biology of psychiatric illness

Psychiatry in the Elderly Robin Jacoby, Catherine Oppenheimer, 2002 Old age psychiatry continues to grow as speciality driven by research advances demographics and political will Psychiatric services and treatments for the old are improving and the outlook for further progress is encouraging In this new edition of the classic textbook of old age psychiatry Robin Jacoby and Catherine Oppenheimer have retained the coherent structure of previous editions approaching the topic under the section headings of basic sciencej clinical practice psychiatric services and specific disorders however within this logical structure they have conducted a major revision bringing in a number of new authors and covering the full range of new research The exciting developments in the field of molecular biology are covered as are the improvements in our understanding of the pathogenesis of the dementias specifically although not limited to Alzheimer s Disease All of the chapters in this new edition have been revised and updated and there are new chapters on quality of life measurement the economics of care suicide in old age hallucinations and functional symptoms in Parkinson s Disease The team of expert contributors has grown to 62 in number representing a wide range of specialities and providing input from nine different countries This has resulted in the most comprehensive and holistic review of the field Psychiatry in the Elderly continues to be essential reading for trainees practicing psychiatrists and those in other branches of care whose work brings them into contact with elderly psychiatric patients *Neuropsychological Studies of Nonfocal Brain Damage* Harry

Whitaker, 2012-12-06 In summary considerable controversy and research have been generated from the automatic effortful distinction Hasher and Zacks 1979 initially stated that all manipulations e g practice individual differences such as age orienting instructions must produce null effects in order to satisfy the criteria that a process is automatic However Zacks et al 1984 have more recently noted that automatic processes may range in degree from relative insensitivity to task and subject variables e g frequency processing to those that are more vulnera ble to disruptive effects e g temporal processing A review of the literature reveals that individuals are sensitive to frequency information even if manipUla tions alter the slope of the judgments Perhaps the application of dual task metho dology to the measurement of capacity demands will be useful in classifying processes along an attentional continuum Moreover there has been a tendency to dichotomize automatic effortful processes rather than to characterize them as ranging from low to high attentional demands Recent evidence Maki Ostby 1987 suggests that attention may be important only in the initial early stages of processing frequency information Therefore a major difference that may emerge between automatic and effortful processing could be the degree of sus tained attention required from individuals In the following section we review the findings obtained in the application of the automatic effortful framework to the elderly and neurological psychiatric populations **Imaging of the Brain** Thomas P. Naidich,
