An abstract graphic consisting of a grid of small squares that form a curved, three-dimensional surface. The grid lines are perspective-drawn, creating a sense of depth and movement as they recede into the distance. The squares are arranged in a pattern that suggests a mathematical or geometric structure, possibly representing a surface or a field of data points.

**Mathematical Simulation in Glass Technology** Dieter Krause, Horst Loch, 2012-12-06 This book entitled Mathematical Simulation in Glass Technology is one of a series reporting on research and development activities on products and processes conducted by the Schott Group The scientifically founded development of new products and technical processes has traditionally been of vital importance to Schott and has always been performed on a scale determined by the prospects for application of our special glasses Since the reconstruction of the Schott Glaswerke in Mainz the scale has increased enormously The range of expert knowledge required could never have been supplied by Schott alone It is also a tradition in our company to cultivate collaboration with customers universities and research institutes Publications in numerous technical journals which since 1969 we have edited to a regular schedule as Forschungsberichte research reports describe the results of these cooperations They contain up to date information on various topics for the expert but are not suited as survey material for those whose standpoint is more remote This is the point where we would like to place our series to stimulate the exchange of thoughts so that we can consider from different points of view the possibilities offered by those incredibly versatile materials glass and glass ceramics We would like to share the knowledge won through our research and development at Schott in cooperation with the users of our materials with scientists and engineers interested customers and friends and with the employees of our firm

**Dynamic Modeling of Transport Process Systems** C. A. Silebi, William E. Schiesser, 2012-12-02 This book presents a methodology for the development and computer implementation of dynamic models for transport process systems Rather than developing the general equations of transport phenomena it develops the equations required specifically for each new example application These equations are generally of two types ordinary differential equations ODEs and partial differential equations PDEs for which time is an independent variable The computer based methodology presented is general purpose and can be applied to most applications requiring the numerical integration of initial value ODEs PDEs A set of approximately two hundred applications of ODEs and PDEs developed by the authors are listed in Appendix 8

Chemical Engineering Tanase Gh. Dobre, José G. Sanchez Marcano, 2007-06-18 A description of the use of computer aided modeling and simulation in the development integration and optimization of industrial processes The two authors elucidate the entire procedure step by step

from basic mathematical modeling to result interpretation and full scale process performance analysis They further demonstrate similitude comparisons of experimental results from different systems as a tool for broadening the applicability of the calculation methods Throughout the book adopts a very practical approach addressing actual problems and projects likely to be encountered by the reader as well as fundamentals and solution strategies for complex problems It is thus equally useful for student and professional engineers and chemists involved in industrial process and production plant design construction or upgrading
