

Mathematics + Cancer: An Undergraduate “Bridge” Course in Applied Mathematics*

Abstract. Most undergraduates have limited experience with mathematical modeling. In an effort to respond to various initiatives, such as the recommendations outlined in [S. Glasbeek and M. Montgomery, eds., *GAJMMB: Guidelines for Assessment of Instruction in Mathematical Modeling Education*, SIAM, 2016], this paper describes a course on the mathematical models of cancer growth and treatment. Among its aims is to provide a template for a “bridge” course between the traditional calculus and differential equations sequence and more advanced courses in mathematics and statistics. Prerequisites include a course in ordinary differential equations. Linear algebra is a useful conceptual tool but no previous programming experience is required. The content includes classical models of tumor growth as well as models for the growth of specific cancer types. Relevant research articles are provided for further study. Material for student projects and effective communication is supplied, as well as suggestions for homework assignments and computer labs. This paper aims to assist instructors in developing their own “Mathematics + Cancer” course.

1. Introduction. This paper describes an undergraduate course, accessible to students who have completed a standard sequence of calculus and ordinary differential equations, on the mathematical modeling of cancer. The content and format of the course are derived from the authors’ experiences in advising undergraduates in a program funded by the National Science Foundation’s Mentoring through Critical Transition Points (MCTP) initiative. Our objectives in developing this course are threefold. First, we are interested in providing a model of a “bridge” course between the traditional calculus sequence and higher-level courses besides the typical “introduction to proof” class. Second, our effort is an attempt to develop an introductory course in applied mathematics that addresses a compelling scientific and social prob-

Mathematics For Cancer Education:

Advancing Cancer Education and Healthy Living in Our Communities Yuri Quintana, Aubrey Van Kirk Villalobos, Dorothy May, 2012 Over half the deaths from disease in the world are now due to just four chronic conditions: diabetes, lung diseases, some cancers, and heart disease. Health and education are inextricably linked. Developing and delivering effective, scalable, and sustainable education programs which lead to real behavioral change would influence some of the common risk factors for these diseases, such as smoking, poor diet, and lack of physical activity. This book contains the selected papers from the St. Jude Cure4Kids Global Summit held in June 2011 at St. Jude Children's Research Hospital in Memphis, Tennessee, USA. The aim of this three-day conference was to improve health and science education in classrooms and communities around the world. Leading educators, innovators, and pioneers in the field of public health came together in a multidisciplinary forum to explore examples of successful education programs, analyze the challenges in designing effective, scalable, and cost-efficient public health education programs, and identify strategies, methodologies, and incentives for developing future programs capable of yielding large-scale improvements in health outcomes for diverse communities. The papers presented here provide a foundation in the key topics necessary to create future innovative health promotion programs and will be of interest to all those whose work involves improving health outcomes by means of better and more effective health education.

Mathematics as an Educational Task Hans Freudenthal, 2012-12-06 Like prefaces, prefaces are usually composed last. Putting them in the front of the book is a feeble reflection of what, in the style of mathematics treatises and textbooks, I usually call the didactical inversion: to be fit to print, the way to the result should be the inverse of the order in which it was found. In particular, the key definitions which were the finishing touch to the structure are put at the front. For many years, I have contrasted the didactical inversion with the thought experiment. It is true that you should not communicate your mathematics to other people in the way it occurred to you, but rather as it could have occurred to you if you had known then what you know now, and as it would occur to the student if his learning process is being guided. This, in fact, is the gist of the lesson Socrates taught Meno's slave. The thought experiment tries to find out how a student could reinvent what he is expected to learn. I said about the preface that it is a feeble reflection of the didactical inversion. Indeed, it is not a constituent part of the book. It can even be torn out. Yet it is useful. Firstly, to the reviewer who then need not read the whole work, and secondly, to the author himself, who like the composer gets an opportunity to review the leitmotifs of the book.
