Dayawansa,Anders Lindquist,Yishao Zhou,2005-08-31 This volume contains a collection of papers in control theory and applications presented at a conference in honor of Clyde Martin on the occasion of his 60th birthday held in Lubbock Texas November 14 15 2003 *Trace Inequalities* Airat M. Bikchentaev,Fuad Kittaneh,Mohammad Sal Moslehian,Yuki Seo,2024-12-18 This book is a comprehensive and advanced exploration of trace inequalities in the context of matrices and operators acting on Hilbert spaces Its goal is to present elegant inequalities with innovative proofs Instead of presenting generalized versions that can be complicated and lack clarity the book focuses on beautiful and original inequalities Divided into eight chapters this book is designed for researchers and graduate students in mathematics physics and engineering It provides detailed explanations for most of the results and includes a variety of exercises and problems to help readers understand the content and inspire further research into advanced topics **Parameter Estimation for Scientists and Engineers** Adriaan van den Bos,2007-08-03 The subject of this book is estimating parameters of expectation

models of statistical observations The book describes the most important aspects of the subject for applied scientists and engineers This group of users is often not aware of estimators other than least squares Therefore one purpose of this book is to show that statistical parameter estimation has much more to offer than least squares estimation alone In the approach of this book knowledge of the distribution of the observations is involved in the choice of estimators A further advantage of the chosen approach is that it unifies the underlying theory and reduces it to a relatively small collection of coherent generally applicable principles and notions **Convex Optimization & Euclidean Distance Geometry** Jon Dattorro,2005 The study of Euclidean distance matrices EDMs fundamentally asks what can be known geometrically given onlydistance information between points in Euclidean space Each point may represent simply locationor abstractly any entity expressible as a vector in finite dimensional Euclidean space The answer to the question posed is that very much can be known about the points the mathematics of this combined study of geometry and optimization is rich and deep Throughout we cite beacons of historical accomplishment The application of EDMs has already proven invaluable in discerning biological molecular conformation The emerging practice of localization in wireless sensor networks the global positioning system GPS and distance based pattern recognitionwill certainly simplify and benefit from this theory We study the pervasive convex Euclidean bodies and their various representations In particular we make convex polyhedra cones and dual cones more visceral through illustration andwe study the geometric relation of polyhedral cones to nonorthogonal bases biorthogonal expansion We explain conversion between halfspace and vertex descriptions of convex cones we provide formulae for determining dual cones and we show how classic alternative systems of linear inequalities or linear matrix inequalities and optimality conditions can be explained by generalized inequalities in terms of convex cones and their duals The conic analogue to linear independence called conic independence is introducedas a new tool in the study of classical cone theory the logical next step in the progression linear affine conic Any convex optimization problem has geometric interpretation This is a powerful attraction the ability to visualize geometry of an optimization problem We provide tools to make visualization easier The concept of faces extreme points and extreme directions of convex Euclidean bodiesis explained here crucial to understanding convex optimization The convex cone of positive semidefinite matrices in particular is studied in depth We mathematically interpret for example its inverse image under affine transformation and we explainhow higher rank subsets of its boundary united with its interior are convex The Chapter on Geometry of convex functions observes analogies between convex sets and functions The set of all vector valued convex functions is a closed convex cone Included among the examples in this chapter we show how the real affinefunction relates to convex functions as the hyperplane relates to convex sets Here also pertinent results formultidimensional convex functions are presented that are largely ignored in the literature tricks and tips for determining their convexityand discerning their geometry particularly with regard to matrix calculus which remains largely unsystematizedwhen compared with the traditional practice of ordinary calculus Consequently we collect some results of

matrix differentiation in the appendices The Euclidean distance matrix EDM is studied its properties and relationship to both positive semidefinite and Gram matrices We relate the EDM to the four classical axioms of the Euclidean metric thereby observing the existence of an infinity of axioms of the Euclidean metric beyondthe triangle inequality We proceed byderiving the fifth Euclidean axiom and then explain why furthering this endeavoris inefficient because the ensuing criteria while describing polyhedra grow linearly in complexity and number Some geometrical problems solvable via EDMs EDM problems posed as convex optimization and methods of solution arepresented eg we generate a recognizable isotonic map of the United States usingonly comparative distance information no distance information only distance inequalities We offer a new proof of the classic Schoenberg criterion that determines whether a candidate matrix is an EDM Our proofrelies on fundamental geometry assuming any EDM must correspond to a list of points contained in some polyhedron possibly at its vertices and vice versa It is not widely known that the Schoenberg criterion implies nonnegativity of the EDM entries proved here We characterize the eigenvalues of an EDM matrix and then devisea polyhedral cone required for determining membership of a candidate matrix in Cayley Menger form to the convex cone of Euclidean distance matrices EDM cone ie a candidate is an EDM if and only if its eigenspectrum belongs to a spectral cone for EDM N We will see spectral cones are not unique In the chapter EDM cone we explain the geometric relationship betweenthe EDM cone two positive semidefinite cones and the elliptope We illustrate geometric requirements in particular for projection of a candidate matrixon a positive semidefinite cone that establish its membership to the EDM cone The faces of the EDM cone are described but still open is the question whether all its faces are exposed as they are for the positive semidefinite cone The classic Schoenberg criterion relating EDM and positive semidefinite cones isrevealed to be a discretized membership relation a generalized inequality a new Farkas like lemma between the EDM cone and its ordinary dual A matrix criterion for membership to the dual EDM cone is derived thatis simpler than the Schoenberg criterion We derive a new concise expression for the EDM cone and its dual involvingtwo subspaces and a positive semidefinite cone Semidefinite programming is reviewedwith particular attention to optimality conditionsof prototypical primal and dual conic programs their interplay and the perturbation method of rank reduction of optimal solutions extant but not well known We show how to solve a ubiquitous platonic combinatorial optimization problem from linear algebra the optimal Boolean solution x to Ax b via semidefinite program relaxation A three dimensional polyhedral analogue for the positive semidefinite cone of 3X3 symmetricmatrices is introduced a tool for visualizing in 6 dimensions In EDM proximitywe explore methods of solution to a few fundamental and prevalentEuclidean distance matrix proximity problems the problem of finding that Euclidean distance matrix closestto a given matrix in the Euclidean sense We pay particular attention to the problem when compounded with rank minimization We offer a new geometrical proof of a famous result discovered by Eckart Young in 1936 regarding Euclideanprojection of a point on a subset of the positive semidefinite cone comprising all positive semidefinite matriceshaving rank not exceeding a prescribed

limit rho We explain how this problem is transformed to a convex optimization for any rank rho      Theory And Practice Of Control And Systems - Proceedings Of The 6th Ieee Mediterranean Conference Antonio Tornambe,Giuseppe Conte,Anna Maria Perdon,1999-01-04 This volume gathers together all the lectures presented at the 6th IEEE Mediterranean Conference It focuses on the mathematical aspects in the theory and practice of control and systems including stability and stabilizability robust control adaptive control robotics and manufacturing these topics are under intense investigation and development in the engineering and mathematics communities The volume should have immediate appeal for a large group of engineers and mathematicians who are interested in very abstract as well as very concrete aspects of control and system theory
