Quantitative Geosciences: Data Analytics, Geostatistics, Reservoir Characterization and Modeling Y. Z. Ma, 2019-07-15 Earth science is becoming increasingly quantitative in the digital age. Quantification of geoscience and engineering problems underpins many of the applications of big data and artificial intelligence. This book presents quantitative geosciences in three parts. Part 1 presents data analytics using probability statistical and machine learning methods. Part 2 covers reservoir characterization using several geoscience disciplines including geology geophysics petrophysics and geostatistics. Part 3 treats reservoir modeling resource evaluation and uncertainty analysis using integrated geoscience engineering and geostatistical methods. As the petroleum industry is heading towards operating oil fields digitally a multidisciplinary skillset is a must for geoscientists who need to use data analytics to resolve inconsistencies in various sources of data model reservoir properties evaluate uncertainties and quantify risk for decision making. This book intends to

serve as a bridge for advancing the multidisciplinary integration for digital fields The goal is to move beyond using quantitative methods individually to an integrated descriptive quantitative analysis In big data everything tells us something but nothing tells us everything This book emphasizes the integrated multidisciplinary solutions for practical problems in resource evaluation and field development

Uncertainty Analysis and Reservoir Modeling Y. Zee Ma, Paul R. La Pointe, 2011-12-20

Shared Earth Modeling Michel Perrin, Jean-François Rainaud, 2013 Over the last two decades earth modeling has become a major investigative tool for evaluating the potential of hydrocarbon reservoirs Earth modelling must now face new challenges since petroleum exploration no longer consists in only investigating newly identified resources but also in re evaluating the potential of previously investigated reservoirs in the light of new prospecting data and of revised interpretations Earth models incorporate a variety of different interpretations made on various types of data at successive steps of the modeling process However current modeling procedures provide no way to link a range of data and interpretations with a final earth model For this reason sharing and exchanging information about the model building process is at present a major difficulty Recently the term Shared Earth Modeling has been used for expressing the idea that earth models should be built in such a way that experts and end users can have access at any time to all the information incorporated into the model This information does not only concern the data but also the knowledge that geoscientists produce by interpreting these data Accordingly practical solutions must be studied for operating a knowledge driven approach of Shared Earth Modeling This is the goal of this book This study of earth subsurface modeling is intended for several categories of readers It concerns in the first place geologists engineers and managers involved in the study and evaluation of subsurface reservoirs and hydrocarbon exploration Relying on recent progress in various fields of computer sciences the authors present innovative solutions for solving the critical issue of knowledge exchange at key steps of the modeling process This book will also be of interest to researchers in computer science and more generally to engineers researchers and students who wish to apply advanced knowledge based techniques to complex engineering problems

L. Buryakovskiy, N.A. Eremenko, M.V. Gorfunkel, G.V. Chilingarian, 2005-10-13 This book discusses the progress that is being made through innovations in instrumental measurements of geologic and geochemical systems and their study using modern mathematical modeling. It covers the systems approach to understanding sedimentary rocks and their role in evolution and containment of subsurface fluids. Fundamental aspects of petroleum geology and geochemistry: generation, migration, accumulation, evaluation, and production of hydrocarbons are discussed with worldwide examples. Various physical and chemical properties of subsurface waters, crude oils, and natural gases are described, which is especially important to production engineering. Among various properties of liquid and gaseous hydrocarbons, the most important are wettability affecting production characteristics and ultimate recovery, relative permeability affecting reservoir fluid flow to the production wells, density differences between immiscible fluids which affects gravity drainage, viscosity of subsurface fluids affecting the relative mobility of each fluid, and fluid chemistry which affects the absorption, ultimate recovery, and monetary value of produced hydrocarbons. Discussion of the formation and accumulation of hydrocarbons includes: 1) the changes in the chemical composition of hydrocarbons that originate from the debris of living plants and organisms to form crude oil and natural gas; 2) the origin of hydrocarbons in different areas of a single reservoir; 3) the conditions which determine the distribution of water, oil, and gas in the reservoir; 4) the migration of subsurface fluids until they eventually accumulate in isolated traps; 5) discussion of the traps as a function of sedimentary geology and tectonics. This is based on the systems approach to the specific geologic and geochemical systems using analytical and statistical principles and examples of modern mathematical modeling of static and dynamic systems. Discusses fundamental aspects of petroleum geology and geochemistry and generation, migration, accumulation, evaluation, and production of hydrocarbons. Presents a systems approach to the specific geologic and geochemical systems. **Modelling of Engineering and Technological Problems**
