Computer Simulation of Aerial Target Radar Scattering, Recognition, Detection, and Tracking Yakov D. Shirman, 2002 Here's a ground-breaking new book that provides you with the knowledge you need to perform effective computer simulation of scattering for the real targets and conditions of radio wave propagation. By replacing field tests with the computer simulation methods presented in this unique resource, you save time and money in the early stages of research and development. Supplemented with 283 equations and 121 illustrations, you get practical guidance in estimating the effect of various signatures of new radar with target recognition, evaluating and comparing the effectiveness and complexity of recognition algorithms before they are actually introduced into radar, formulating requirements to radar subsystems and evaluating their tolerances and predicting future radar performance. What's more, the book helps you perform initial simulation of the recognition algorithm in various conditions where the practical receiving of experimental data is restricted. Other key discussions include the theory of target recognition, results of studying various recognition methods and simulation in radar detection and tracking.

Principles of Modern Radar Missile Seekers Evgeny Markin, 2022-02-28 This book gives you an in-depth look into the critical function of interference shielding for onboard radar of anti-aircraft missile systems. Intended for radar engineers and technicians specializing in anti-aircraft defense, the book reviews today's military and geopolitical threats, helps you understand the functional needs of the various radar and anti-missile systems to meet those threats, and synthesizes considerations for devising practical and effective protection against interferences that affect the homing heads of anti-aircraft guided missiles. Three problematic interferences are presented and discussed in detail: polarization interference, interference to the sidelobe of onboard antennas, and interference from two points in space, including interference reflected from the earth-water surface. The book covers the basic principles of radiolocation, including monopulse radars, and gives insight into the fundamental functional units of anti-aircraft missiles and surface-to-air missile systems. The book presents guidance methods, systems of direction-finding problems on firing over the horizon, and questions of accuracy and resolution, all important for better addressing solutions of interference shielding. You will learn how to estimate the stability of target auto-tracking under conditions of cited interferences and better assess existing limitations on firing over the horizon by a long-range anti-aircraft system, as well as hypersonic targets and satellites. This is a unique and valuable resource for engineers and technicians who are involved in the design and development of anti-aircraft guided missile systems, with special emphasis on interference immunity and protection. It can also be used as a textbook in advanced radar technology coursework and seminars.
