Radiant Energy and the Eye Sidney Lerman, 1980 **The Pathological Effects of Radiant Energy on the Eye, an Experimental Investigation** Louis Bell, Frederick Herman Verhoeff, 2025-05-22 The Pathological Effects of Radiant Energy on the Eye an Experimental Investigation delves into the impact of radiant energy on ocular health Authored by Louis Bell and Frederick Herman Verhoeff this study presents an experimental analysis of how radiant energy affects the eye providing insights into the mechanisms of damage and potential pathological outcomes This research is invaluable for understanding the physiological responses to radiation and informs practices in ophthalmology and radiation safety It remains a vital resource for researchers and practitioners examining the intersection of physics medicine and environmental health This work has been selected by scholars as being culturally important and is part of the knowledge base of civilization as we know it This work was reproduced from the original artifact and remains as true to the original work as possible Therefore you will see the original copyright references library stamps as most of these works have been housed in our most important libraries around the world and other notations in the work This work is in the public domain in the United States of America and possibly other nations Within the United States you may freely copy and distribute this work as no entity individual or corporate has a copyright on the body of the work As a reproduction of a historical artifact this work may contain missing or blurred pages poor pictures errant marks etc Scholars believe and we concur that this work is important enough to be preserved reproduced and made generally available to the public We appreciate your support of the preservation process and thank you for being an important part of keeping this knowledge alive and relevant **The Pathological Effects of Radiant Energy on the Eye** Frederick Herman Verhoeff, Louis Bell, 1916 *The Pathological Effects of Radiant Energy on the Eye* Frederick Herman Verhoeff, Louis Bell, 1916 **The Pathological Effects of Radiant Energy on the Eye** F. H. Verhoeff, 2017-11-26 Excerpt from The Pathological Effects of Radiant Energy on the Eye An Experimental Investigation All radiant energy is at present believed to consist of transverse vibrations in the hypothetical ether all propagated at the same rate and differing only in amplitude and wave length hence in frequency which is the reciprocal of wave length The uniform propagation rate in vacuo is very nearly km Per second and the wave lengths so far as ordinarily dealt with range from about 01 to about 0002 mm For ordinary purposes no attention need be paid to the extremely long wave lengths ranging to 1 mm to the extremely short ones between 0001 and 0002 mm or to the enormously shorter one still of the order of magnitude of 0000001 111m Such as the X rays are believed to be For the very long waves are not present in material amount in the radiation from ordinary sources The very short ones are absorbed by a few cm Or dm Of air and the X rays are practically only produced in apparatus intended for that purpose The spectra given by all ordinary sources range between the more modest limits just given In the earlier literature this spectral range used to be divided into heat rays light rays and actinic rays a distinction wholly artificial since the three effects implied are far from being sharply defined More generally the whole

range is divided into the infra red portion not ordinarily visible and extending from the longest waves to those of about 760 1111 the visible spectrum extending from about 7601111 to about 395 and the ultra violet portion reaching from 395 up to the neighborhood of 200 mμ This distinction is not rigorous or with sharp limits While artificial distinctions have led to many misunderstandings 1_ all radiation of Whatever wave length is convertible into heat when absorbed by material bodies and may produce chemical changes as well As a matter of fact these latter show a general tendency to increase with the frequency of the oscillations so that chemical changes are rare in the infra red and increasingly frequent as one approaches the extreme ultra violet It is this tendency that is shown in the pathological changes which may be caused in living cells by the incidence of radiation About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books Find more at www.forgottenbooks.com This book is a reproduction of an important historical work Forgotten Books uses state of the art technology to digitally reconstruct the work preserving the original format whilst repairing imperfections present in the aged copy In rare cases an imperfection in the original such as a blemish or missing page may be replicated in our edition We do however repair the vast majority of imperfections successfully any imperfections that remain are intentionally left to preserve the state of such historical works
