Bruce King, 2009-01-16 One of the landmarks in the history of mathematics is the proof of the nonexistence of algorithms based solely on radicals and elementary arithmetic operations addition subtraction multiplication and division for solutions of general algebraic equations of degrees higher than four This proof by the French mathematician Evariste Galois in the early nineteenth century used the then novel concept of the permutation symmetry of the roots of algebraic equations and led to the invention of group theory an area of mathematics now nearly two centuries old that has had extensive applications in the physical sciences in recent decades The radical based algorithms for solutions of general algebraic equations of degrees 2 quadratic equations 3 cubic equations and 4 quartic equations have been well known for a number of centuries The quadratic equation algorithm uses a single square root the cubic equation algorithm uses a square root inside a cube root and the quartic equation algorithm combines the cubic and quadratic equation algorithms with no new features The details of the formulas for these equations of degree d $d \geq 3$ relate to the properties of the corresponding symmetric groups S_d which are isomorphic to the symmetries of the equilateral triangle for $d = 3$ and the regular tetrahedron for $d = 4$ *Beyond The Learning Organization* Jerry Gilley, 2000-01-07 The next step in organizational development showing companies how to integrate all areas of human resource practice to drive continuous learning **Beyond Reason and Tolerance** Robert J.
