

Reflections in Time

Above there is reflection
Colorful and bright
Dancing in the sunlight
Shimmering at night

Just below the surface
Another world awaits
Holding onto mysteries
Until some future date

Our view will let us marvel
That these two coexist
And think on our experiences
And those we might have missed

The world is full of beauty
And also some surprise
Perhaps it is the future
Reflecting in our eyes

Enhancement for Impulse Response Measurement Xun Wang,2014 Impulse response measurements that are performed outdoors are highly susceptible to the uncertainties caused by the non perfect measurement setup the presence of background noise and fluctuations in media such as wind and temperature drift This work concentrates on two scenarios the measurement of reflection coefficients of noise barriers and the influence of temperature variances in machinery cavities Regarding the sound barrier measurement outdoors a linear four microphone array can be used to separate direct sound and reflected sound if the sound barrier does not include complicated scattering structures With regard to the impulse response of an air borne sound measurement for a machine monitoring system a time warping model for inter period and intra period temperature variances is investigated **Tau-p: a plane wave approach to the analysis of seismic data** P.L

Stoffa,2012-12-06 In exploration seismology data are acquired at multiple source and receiver positions along a profile line These data are subsequently processed and interpreted The primary result of this process is a subsurface image of the exploration target As part of this procedure additional information is also obtained about the subsurface material properties e g seismic velocities The methods that are employed in the acquisition and processing of exploration seismic data are internally consistent That is principally near vertical incidence seismic waves are generated recorded and subsequently imaged The data processing methods commonly used are based upon a small angle of incidence approximation thus making the imaging problem tractable for existing data processing technology Although tremendously successful the limitations of this method are generally recognized Current and future exploration goals will likely require the use of additional seismic waves i e both compressional and shear precritical and postcritical reflections and refractions Also in addition to making better use of seismic travel times recent efforts to directly incorporate seismic amplitude variations show that the approach may lead to a better understanding of subsurface rock properties In response to more demanding exploration goals recent data acquisition techniques have improved significantly by increasing the spatial aperture and incorporating a large number of closely spaced receivers The need for better subsurface resolution in depth and position has encouraged the use of 240 512 and even 1024 recorded data channels with receiver separations of 5 to 25 m **Seismic Interferometry** Gerard Thomas Schuster,2009-05-14 Describes the theory and practice of seismic interferometry for academic researchers oil
