Shaped Crystal Growth:

Shaped Crystal Growth V.A. Tatarchenko, 2013-03-09 The monograph *Shaped Crystal Growth* by V A Tatarchenko is the first systematic of the macroscopic crystallization theory The theory is based on the stable state growth conception which means that self stabilization is present in the system with growth parameter deviations occurring under the action of external perturbations attenuating with time The crystallization rate is one of the parameters responsible for crystal defect formation Steady state crystal growth means that crystallization rate internal stabilization is present thus allowing more perfect crystals to grow Most important is the fact that the crystal shape an easily observed parameter is one of the stable growth characteristics when growing crystals without any contact with the crucible walls This means that constant cross section crystal growth is to a certain extent evidence of crystallization process stability The principles of the stable crystal growth theory were developed by the author of the monograph in the early 1970s Due to the efforts over the past 20 years of V A Tatarchenko his disciples V A Borodin S K Brantov E A Brener G I Romanova G A Satunkin et al and his followers B L Timan O V Kolotiy et al the theory has been completed which is demonstrated by this monograph The characteristic feature of the theory is its trend towards solving practical problems that occur in the process of crystal growth

50 Years Progress in Crystal Growth Robert Feigelson,2004-07-09 There is no question that the field of solid state electronics which essentially began with work at Bell laboratories just after World War II has had a profound impact on today s Society What is not nearly so widely known is that advances in the art and science of crystal growth underpin this technology Single crystals once valued only for their beauty are now found in one form or another in most electronic optoelectronic and numerous optical devices These devices in turn have permeated almost every home and village throughout the world In fact it is hard to imagine what our electronics industry much less our entire civilization would have been like if crystal growth scientists and engineers were unable to produce the large defect free crystals required by device designers This book brings together two sets of related articles describing advances made in crystal growth science and technology since World War II One set is from the proceedings of a Symposium held in August 2002 to celebrate 50 years of progress in the field of crystal growth The second contains articles previously published in the newsletter of the American Association for Crystal Growth in a series called Milestones in Crystal Growth The first section of this book contains several articles which describe some of the early history of crystal growth prior to the electronics revolution and upon which modern crystal growth science and technology is based This is followed by a special article by Prof Sunagawa which provides some insight into how the successful Japanese crystal growth industry developed The next section deals with crystal growth fundamentals including concepts of solute distribution interface kinetics constitutional supercooling morphological stability and the growth of dendrites The following section describes the growth of crystals from melts and solutions while the final part involves thin film growth by MBE and OMVPE These articles were written by some of the most famous theorists and crystal growers working in the field They will provide future research workers with valuable insight into how these pioneering discoveries were made and show how their own research and future devices will be based upon these developments Articles written by some of the most famous theorists and crystal growers working in the field Valuable insight into how pioneering discoveries were made Show how their own research and future devices will be based upon these developments

Growth of Crystals E. Givargizov, 2012-12-06 The present volume continues the tradition of the preceding volumes covering a wide range of crystal growth problems and treating aspects of critical importance for crystallization Changes in this field of knowledge have however changed the criteria for selection of papers for inclusion in this series The increasing role of crystals in science and technology is even more apparent today The study and utilization of these highly perfect objects of nature considerably facilitates progress in the physics and chemistry of solids quantum electronics optics microelectronics and other sciences The demand for crystals and crystal devices has grown steadily and has led to the emergence and rapid growth of the single crystal industry we can safely say that the state of the art in this industry is indicative of the overall scientific and technological potential of a country At the same time the introduction of crystallization techniques into other industries is gaining ever increasing importance To illustrate this last statement we can mention the fabrication of textured structural materials and direct methods of metal reduction in ores by using chemical vapor transport techniques Crystallization techniques progress both in width and in depth traditional methods are modernized and novel techniques appear some of them at the junction of the already existing technologies for example flux growth of crystals growth from vapor with participation of the liquid phase etc
