Shellsort And Sorting Networks:

Shellsort and Sorting Networks Vaughan R. Pratt, Stanford University. Computer Science Department, 1972 Shellsort is a particular method of sorting data on digital computers Associated with each variant of Shellsort is a sequence of integers that characterizes that variant In the paper the author answers some open questions about the speed of Shellsort with certain characteristic sequences and suggests a novel application of Shellsort namely to sorting networks Shellsort with any characteristic sequence that approximates a geometric progression and that has short coprime subsequences through takes $O(n^3)$ units of time For any sequence that approximates a geometric progression with an integer common ratio this bound is the best possible However if the sequence consists of the descending sequence of positive integers less than n and having only 2 and 3 as prime factors then Shellsort takes only $O(n \log^2 n)$ units of time Sorting networks based on Shellsort with this sequence operate approximately 1.5 times as fast as with previous methods Author

Hofri,2012-12-06 Probabilistic Analysis of Algorithms begins with a presentation of the tools of the trade currently used in probabilistic analyses and continues with an applications section in which these tools are used in the analysis of selected algorithms The tools section of the book provides the reader with an arsenal of analytic and numeric computing methods which are then applied to several groups of algorithms to analyze their running time or storage requirements characteristics Topics covered in the applications section include sorting communications network protocols and bin packing While the discussion of the various algorithms is sufficient to motivate their structure the emphasis throughout is on the probabilistic estimation of their operation under distributional assumptions on their input Probabilistic Analysis of Algorithms assumes a working knowledge of engineering mathematics drawing on real and complex analysis combinatorics and probability theory While the book is intended primarily as a text for the upper undergraduate and graduate student levels it contains a wealth of material and should also prove an important reference for researchers As such it is addressed to computer scientists mathematicians operations researchers and electrical and industrial engineers who are interested in evaluating the probable operation of algorithms rather than their worst case behavior

A Practical Approach to High-Performance Computing Sergei Kurgalin,Sergei Borzunov,2019-11-10 The book discusses the fundamentals of high performance computing The authors combine visualization comprehensibility and strictness in their material presentation and thus influence the reader towards practical application and learning how to solve real computing problems They address both key approaches to programming modern computing systems multithreading based parallelizing in shared memory systems and applying message passing technologies in distributed systems The book is suitable for undergraduate and graduate students and for researchers and practitioners engaged with high performance computing systems Each chapter begins with a theoretical part where the relevant terminology is introduced along with the basic theoretical results and methods of parallel programming and concludes with a list of test questions and problems of varying difficulty The authors include many solutions and hints and often sample code

Entropy, Search, Complexity Imre Csiszár, Gyula O.H. Katona, Gabor Tardos, 2007-04-05 The present volume is a collection of survey papers in the elds given in the title They summarize the latest developments in their respective areas More than half of the papers belong to search theory which lies on the borderline of mathematics and computer science information theory and combinatorics respectively The volume is slightly related to the twin conferences Search And Communication Complexity and Information Theory In Mathematics held at Balatonlelle Hungary in 2000 These conferences led us to believe that there is a need for such a collection of papers The paper written by Martin Aigner starts with the following relatively new search problem Given n boolean variables as input one has to find one of them whose value is in majority The goal is to minimize the number of tests needed for this where one test is to compare two input variables for equality The paper surveys the large set of problems and results which grew out of this one In the traditional search model an unknown element is sought in a finite set based on the information that the unknown element is or is not in some asked

subsets A variant is when a 0 1 function is given on the underlying set and only the values of this function at the unknown element x is sought rather than x itself This is called the recognition problem

The SIMD Model of Parallel Computation Robert Cypher, Jorge L.C. Sanz, 2012-12-06

1.1 Background

There are many paradigmatic statements in the literature claiming that this is the decade of parallel computation A great deal of research is being devoted to developing architectures and algorithms for parallel machines with thousands or even millions of processors Such massively parallel computers have been made feasible by advances in VLSI very large scale integration technology In fact a number of computers having over one thousand processors are commercially available Furthermore it is reasonable to expect that as VLSI technology continues to improve massively parallel computers will become increasingly affordable and common However despite the significant progress made in the field many fundamental issues still remain unresolved One of the most significant of these is the issue of a general purpose parallel architecture There is currently a huge variety of parallel architectures that are either being built or proposed The problem is whether a single parallel computer can perform efficiently on all computing applications
