Lynch,2018-01-18 The concept of reinforcing a material by the use of a fiber is not a new one The Egyptian brick layer employed the same principle more than three thousand years ago when straw was incorporated into the bricks More recent examples of fiber reinforced composites are steel reinforced concrete nylon and rayon cord reinforced tires and fiberglass reinforced plastics In the last several years considerable progress has been made on new composite structures particularly utilizing boron on tungsten substrate fibers in various matrices Many of these advances have been reviewed recently by P M Sinclair¹ and by Alexander Shaver and Withers ² An excellent earlier survey is available by Rauch Sutton and McCreight ³ Boron reinforced epoxy composites are being fabricated and tested as jet engine components fuselage components and even as a complete aircraft wing because of the tremendous gain in experimentally demonstrated properties such as modulus strength and fatigue resistance particularly on a weight normalized e g strength density basis Other than glass epoxy and boron epoxy composites and perhaps boron aluminum the systems now under study are in the early stages of research and development These include other boron metal composites graphite polymer graphite metal graphite alumina metal and aligned eutectic directionally solidified combinations As Sinclair points out designers are wary about filamentary composites because there is little background information and scant experience
