Magic Maize:

Maize Improvement Shabir Hussain Wani, Zahoor Ahmad Dar, Gyanendra Pratap Singh, 2023-03-10 Maize is one of the most generally grown cereal crops at global level followed by wheat and rice. Maize is the major crop in China both in terms of yield and acreage. In 2012 worldwide maize production was about 840 million tons. Maize has long been a staple food of most of the global population particularly in South America and Africa and a key nutrient resource for animal feed and for food industrial materials. Maize belts vary from the latitude 58 north to the latitude 40 south and maize ripens every month of the year. Abiotic and biotic stresses are common in maize belts worldwide. Abiotic stresses chiefly drought, salinity and extreme temperatures together with biotic stresses primarily fungi, viruses and pests negatively affect maize growth, development, production and productivity. In the recent past intense droughts, waterlogging and extreme temperatures have relentlessly affected maize growth and yield. In China 60% of the maize planting area is prone to drought and the resultant yield loss is 20%–30% per year. In India 25%–30% of the maize yield is lost as a result of waterlogging each year. The biotic stresses on maize are chiefly pathogens, fungal, bacterial and viral and the consequential syndromes like ear stalk rot, rough dwarf disease and northern leaf blight are widespread and result in grave damage. Roughly 10% of the global maize yield is lost each year as a result of biotic stresses. For example, the European corn borer ECB *Ostrinia nubilalis* H. borer causes yield losses of up to 2000 million dollars annually in the USA alone. In the northern regions of China the maize yield loss reaches 50% during years when maize is badly affected by northern leaf blight. In addition, abiotic and biotic stresses time and again are present at the same time and rigorously influence maize production. To fulfill requirements of each maize growing situation and to tackle the above mentioned stresses in an effective way, sensibly designed multidisciplinary strategy for developing suitable varieties for each of these stresses has been attempted during the last decade. Genomics is a field of supreme significance for elucidating the genetic architecture of complex quantitative traits and characterizing germplasm collections to achieve precise and specific manipulation of desirable alleles, genes. Advances in genotyping technologies and high throughput phenomics approaches have resulted in accelerated crop improvement like genomic selection, speed breeding particularly in maize. Molecular breeding tools like collaborating all omics has led to the development of maize genotypes having higher yields, improved quality and resilience to biotic and abiotic stresses. Through this book we bring into one volume the various important aspects of maize improvement and the recent technological advances in development of maize genotypes with high yield, high quality and resilience to biotic and abiotic stresses. Edwards,Beatrice Blyth Whiting,2004-01-01 Ngecha is the monumental and intimate study of modernization and nationalization in rural Africa in the early years following Kenyan independence in 1963 as experienced by the people of Ngecha a village outside Nairobi From 1968 to 1973 Ngecha was a research site of the Child Development Research Unit a

team that brought together Kenyan and non Kenyan social scientists under the leadership of John Whiting and Beatrice Blyth Whiting The study documents how families adapted to changing opportunities and conditions as their former colony became a modern nation and the key role that women played as agents of change as they became small scale cash crop farmers and entrepreneurs Mothers modified the culture of their parents to meet the evolving national economy and they participated in the shift from an agrarian to a wage economy in ways that transformed their workloads and perceptions of isolation and individualism within and between households thereby challenging traditional family based morals and obligations Their children in turn experienced evolving educational practices and achievement expectations The elders faced new situations as well as new modes of treatment Completing this valuable record of a nation in transition are the long term reassessments of the observations and conclusions of the research team and a description of Ngecha today as viewed by Kenyans who participated in the original study

Molecular Marker Technology for Crop Improvement José Miguel Soriano, 2021-01-15 Since the 1980s agriculture and plant breeding have changed with the development of molecular marker technology In recent decades different types of molecular markers have been used for different purposes mapping marker assisted selection characterization of genetic resources etc These have produced effective genotyping but the results have been costly and time consuming due to the small number of markers that could be tested simultaneously Recent advances in molecular marker technologies such as the development of high throughput genotyping platforms genotyping by sequencing and the release of the genome sequences of major crop plants have opened new possibilities for advancing crop improvement This Special Issue collects 16 research studies including the application of molecular markers in 11 crop species from the generation of linkage maps and diversity studies to the application of marker assisted selection and genomic prediction
